Cisco waves white flag, changes SNA strategy

By Elisabeth Horwitz
BENLOPARK, CALIF.

The yearlong battle of the Systems Network Architecture internetworking standards officially ended last week.

Cisco Systems, Inc. renounced its efforts to develop a protocol to compete with IBM's Advanced Peer-to-Peer Networking and is moving forward to equip its routers with IBM's SNA internetworking architecture.

The fracas, however, resulted in a clear win for users, observers said. It forced IBM to make APPN a far more open multivendor protocol, said Nancy Vandell, information architect at Chevron Information Technology.

Initially proposed by Cisco about 10 months ago, the Advanced Peer-to-Peer Internet-

working protocol was being developed by Cisco and its allies in the APPN Forum. APPN was to provide users with the same intelligent routing and directory functions that APPN provides for SNA devices but on existing Transmission Control Protocol/Internet Protocol backbones.

This would have saved users from having to implement yet another proprietary IBM protocol over their internetworks, Cisco said. However, APPN had steadily gained user interest and vendor support, particularly from major router vendors other than Cisco and Proteon, Inc. [CW March 15].

Meanwhile, IBM has taken several steps to make APPN more open, including making patents and licenses for the technology [Cisco, page 12].

APPN could be the key to open SNA internetworking

Whither wireless security?

By James Daly

While the growing use of wireless voice and data transmission technology has made executives salivating for its anywhere, anytime communications capabilities, the thought of sensitive data skittering unfettered over the airwaves has made some security managers nervous. They wonder if the benefits are worth the potential for abuse.

"I have to admit that it makes me a little jumpy," said Brian

Redick, director of security and operations at National Security Clearing Corp. in New York. "It's still too early to tell if an outsider could pick off our data."

The arrival of personal digital assistants such as Apple Computer, Inc.'s Newton MessagePad and EO, Inc.'s Personal Communicator, coupled with skyrocketing sales of cellular phones, packet radio modems, sky papers and wireless elec-

tronic-mail devices, has created new points of vulnerability for electronic data interchange, experts say.

"None of us would ever leave a confidential memo lying on a restaurant table, but then we turn around and think twice about transmitting data electronically without a safeguard," said Bob Geisler, a senior consultant at CCT, Inc., a consultant in Minneapolis.

Sybase to unite tool set

Seeks to grab app development back from third parties

By Kim S. Nash
EMMETTSTVILLE, CALIF.

Notoriously weak in the application development arena, Sybase, Inc. plans to disclose Aug. 30 a scheme to house its disparate tools under one roof, sources close to the company said last

Building blocks

Sybase's major application development products

	FUNCTION	PRICE
APM Workbench	SQL for building applications and forms under Unix, VMS and DOS	Added Modif. in June
DBT	Application modeling and analysis tool	Acquired March 1991
Game-Master	Object-oriented tool set for building multimedia programs	Acquired September 1992
CACTUS	Object-oriented modeling suite	To be announced

week. The firm is also expected to unveil an object-oriented tool that has been more than a year in the making.

Sybase's unification strategy hinges on building links between tools in an otherwise disconnected set. Until now, third parties such as Uniface Corp. and Powersoft Corp. have filled the gaps Sybase left open — something Sybase encouraged. But gradually dropping database prices combined with a growing tools market enticed Sybase to enter the development arena, analysts said.

"They're leaving money on the table" with every database sale that does not include tools, said Rob Tholenauer, an analyst at Meta Group, Inc. in Burlingame, Calif.

For example, Chevron Canada Ltd. bought Microsoft Corp.'s Visual Basic when it could not get the Windows tools it wanted from Sybase, said Bill Soper, manager of information services at the oil company in Vancouver, British Columbia. "If we can get it all from Sybase, and

Groupware applications

Notes leads, but flaws cited

By Michael Vizard
SAN JOSE, CALIF.

■ Lotus Development Corp.'s Notes may be groupware's hot dog today, but the company needs to adjust the product's pricing and overcome integration problems for it to remain dominant, observers said at last week's Groupware '93 show.

For Notes to succeed long term, Lotus must adopt a pricing model for the product that is akin to those used by operating systems vendors rather than the PC application model it now uses, analysts said. This will make it less expensive for users to adopt Notes company-wide.

Second, while Notes applications can be integrated across multiple platforms, third-party applications cannot be easily integrated into Notes because there are no common application programming interfaces. This is likely to make Notes' cross-platform architecture a less than compelling issue.

Users and resellers, meanwhile, are pressuring Lotus to deliver a runtime version that will allow applications developed using Notes to be deployed on remote systems inexpensively.

"We have a Notes pilot project that could go to 500 licensees tomorrow. But without a Notes runtime, we'll probably take a day to deploy it. And by that time, who knows what Microsoft will have?" said Carolyn Coughlin Weisberg, Notes engineer at Genesys International in San Francisco.

Lotus is resisting a runtime license option

Groupware headaches. The electrifying growth of groupware applications in business units is creating a whole new set of headaches for IS. Front-line IS managers, such as Max Evergreen of Illinois Power Co., say political battles and integrating SQL databases and back-office operations are among the biggest problems. See story page 8.

because such licenses would preclude end users from developing their own applications, noted Cliff Conneffson, director of Notes marketing.

Weisberg noted, however, that most companies do not have or want end users capable of developing robust Notes applications.

Executive Briefing

It's time to start thinking about security issues with wireless technology. New products and services hitting the market have great end-user appeal but introduce considerable new risks, according to experts. *Page 1.* And risks will only increase as providers start to roll out very high-capacity wireless nets that rival fiber-optic capacity. *Page 63*

The love of groupware is also strong but somewhat risky. The market is proving irresistible for many vendors. Apple just announced a groupware initiative, and even companies such as DEC and Eastman Kodak are getting in on the act. *Page 14.* And customers are finding plenty of applications. For

example, American Airlines plans to expand its Sabre reservation system to accept reservations via fax or E-mail, with E-mail confirmation. *Page 14.* But there's a downside. Users complain that integration of multiple E-mail systems is often difficult (*page 85*), and many are losing patience with vendors' inability to

agree on standards. *Page 15*

In the meantime, vendors are pushing groupware into a spectrum of new areas, including client/server, object orientation, multimedia and video (*page 14*), blurring lines in a manner not unlike what's happening in the convergence of multimedia applications and cable-based interactive television. *Page 69*

The practical intersection of computer and consumer technology may seem a long way off, but it has already started to affect consumers. The promotion of Vicom CI by Henry Leising to senior vice president at that company signals the growing importance of technologists in the multimedia business. *Page 24.*

IN DEPTH

- Consumer and computer technology is converging to produce a "communicopia" of interactive TV and multimedia applications. *Page 89*

Friday Stock Ticker *Page 108*

At somewhat less elevated levels, the explosion of new computer/media combinations has touched off a mini hiring boom for multimedia specialists and holds promise for many more other types of IT professionals, including network and database administrators. The best qualification is knowledge of C++ because most new authoring systems for multimedia are object-based. *Page 89*

Microsoft is reportedly hoping to use its 32-bit version of Visual C++ as an extra tie to bind users to Windows NT. Competition is heating up, and the theory is that whoever controls the development environment will control the operating system. *Page 8*

*Introducing
PC DOS 6.1*

We just did

It's the new PC DOS 6.1
from IBM. And it one-ups
MS-DOS® 6 for a lot of reasons.

For one, it's got improved memory management. The Memory Optimizer not only gives users more memory, but also a configuration watcher to run the system more efficiently.

It's got utilities you don't get with MS-DOS.
For instance, you get a Program Scheduler

MS-DOS 6.0

for any program or DOS command, and a new editor that allows you to edit files at the same time.

It's got features you don't get with MS-DOS. Such as support for PCMCIA Card Services (i.e., hot pluggability for portable users),

and the industry's leading Pen support for DOS.

And there's one more reason that goes beyond the software—PC DOS 6.1

is backed by superior service and support, including a 24-hour helpline you can actually reach. What's more, the first 60 days of support are free.

So if you haven't got PC DOS 6.1, get it from your local software dealer. Or call 1 800 342-6672.

(In Canada, call 1 800 465-7999.)

When you consider all it's got, PC DOS 6.1 from IBM is definitely the one to get.

better.

IBM®

Wanted: Investors to buy Taligent stock

COMPANY LEADERS are requesting support for Taligent, and investors are making moves to buy up shares of the company's stock to keep it from being taken over by another company.

Taligent, Inc., has been involved in negotiations between its top management and investors, sources said. "They wanted to find a way to keep the company independent from IBM, although a deal had yet been reached,"

Analysts say they would continue negotiations.

IBM and Apple are not settling pieces of their stake in the 100% owned firm, but the new claims of stock will affect both buildings, sources said.

According to managers, there was a natural progression for Taligent.

"IBM and Apple never meant this thing to be a closed-out" said Frank Dzubek, president of Communication Network Architects, Inc. in Washington, D.C.

Motorola eyes NT for PowerPC

Takes license, but IBM drags feet on port

By Michael Fitzgerald

Microsoft Corp.'s Windows NT is sneaking through the back door into the PowerPC alliance formed by Motorola, IBM and Apple Computer Inc. But, politics being what they are, some of the companies involved are talking about it through official channels.

Sources close to the deal confirmed a published report that Motorola has licensed NT from Microsoft. But neither company officially confirmed the agreement, in part because IBM is so far as refusing to say it will announce a Windows NT-based version of PowerPC in its initial PowerPC workstations, according to sources.

Observers were split on the reasons behind IBM's reluctance to come out strongly in favor of NT on PowerPC. The PowerPC will be used in systems ranging from

IBM's RISC System/6000 workstations to low-end portables expected sometime in 1994.

"There's a lot of questions in the market about whether NT will do anything on the desktop, so why should IBM help it out?" said William Bluestein, an analyst at Forrester Research, Inc. in Cambridge, Mass.

NT needed

Other analysts disagreed, saying NT support was crucial to PowerPC's future.

Part of the problem is "IBM has multiple groups needing to buy in, instead of just one," which is slowing NT's acceptance within Big Blue, said Frank Dzubek, president of Communication Network Architects, Inc. in Washington, D.C. "It's not a question of [OS/2 operations czar Lee] Reiswig saying not to do that," Dzubek added.

Sources close to IBM said the company fully intends to support NT, but it will let Motorola take the lead in porting it to PowerPC. Both Motorola and IBM recognize how important it is to PowerPC's future for NT to run on the chip, the sources said.

But IBM has focused its development resources on WorkPlace OS, which will run both AIX and OS/2. It is an environment that will lead users to Taligent, IBM and Apple's joint object-oriented operating system venture.

A Microsoft Corp. spokeswoman said it is in Microsoft's best interest to make sure any company that licenses NT succeeds with its port.

"It's a pretty amazing deal for Microsoft — they get something that really helps NT, which is performing slowly on Intel platforms, and got Motorola to pay for it," said Jesse Berst, publisher of the "Windows Watcher" newsletter in Redmond, Wash.

Subnotebooks

Smaller, but better portables arrive

By Michael Fitzgerald

Small packages are starting to contain better things.

Gateway 2000, Inc. highlighted this trend last week by introducing a version of its 2.5-pound HandBook with an Intel Corp. 1496 chip in it, joining IBM PC Co., Hewlett-Packard Co., Zenith Data Systems and Compaq Computer Corp. will follow in the fourth quarter with a 3.8-pound subnotebook that uses intel's 25-MHz SL-enhanced 486SX.

The Compaq box will come in two versions, one with an 85MHz hard drive and one with a 125MHz hard drive. It will also compete head-to-head with the HandBook in terms of pricing, the sources said. The HandBook costs \$1,495 with a 25-MHz 486SX processor and a HandBook with a 25/40-MHz DX2 chip and a 120MB hard drive will cost \$1,795. The unannounced Compaq product is expected to cost \$1,495 with the 85MHz hard drive and \$1,695 with the larger drive.

Compaq will also address one of the main stability problems of subnotebooks by building battery-powered 2.5-in. floppy that can be attached to the machine. Personal Computer Memory Card International Association slot, the sources said. The box will also offer an integrated trackball on the lower-right corner with the buttons built into the side of the screen.

Sources said the box is similar in size to the PC Co.'s 10.1-by 7.5-in. ThinkPad 500, with a "90% keyboard."

Compaq officials refused to comment.

Pleasing options

Analysts said they like the new crop of machines. "We have some good products in the market now, and users can choose from an array of Windows machines instead of receding technology like 256K and CGA screens," said Bruce Stephen, director of PC hardware and pricing research at International Data Corp. in Framingham, Mass.

Some users said they were looking specifically at the subnotebook category, which has drawn only nominal interest but is poised for growth (chart).

"We have a group with a need for 50 laptops, and with having to carry a printer as well, subnotebooks could be ideal," said Roger Bush, microsystems manager at Diversify Corp., a chemical manufacturer in Livonia, Mich.

"I would expect we'll use both notebooks and subnotebooks here, depending on our user needs," said John W. Good, manager of information technology at The Turner Corp., a multinational

construction company based in New York. Good said the activity in the subnotebook market had him interested in evaluating the products, to see whether less heavy-duty computer users would prefer the lighter, floppy-less subnotebooks over their heavier cousins.

Other users said they felt the products on the market were still not quite ready for prime time.

"I like anything that's lightweight, and I like that they're coming with 486s. At some point I'd like to assign these to my people," said Stephen Adams, director of information systems at Statewide Wear, Inc. in New Bedford, Mass. Adams cited small screens and hard drives as reasons why subnotebooks were still "not really workable. They're getting better, but for the extra couple of pounds I'll stick with notebooks for now."

The new class of subnotebooks varies according to vendor. HP's OmniBook 300, for example, uses a 486 processor and backlit screens. Analysts said it was still not clear whether the OmniBook's numerous features, such as read-only memory-based software, wireless communications and the ability to run on alkaline

batteries, would help it beat systems built with faster processors and brighter screens.

Subnotebooks appear to be an important developing category and one that IS managers should adopt a proactive stance toward, analysts said.

"IS will really have to pay attention to these because they'll be so cheap that a lot of individuals will buy them, and all of a sudden IS will see this menagerie of bidders that people will want to have them support," said William Bluestein, an analyst at Forrester Research, Inc. in Cambridge, Mass.

Users and analysts were unclear how subnotebooks will fare against pen-based systems such as the AT&T/Ericsson Communicator. But the declining subnotebook price will likely create more user interest.

"They're still too expensive for a competitor that doesn't have the full capability of a notebook," said Enrique Crespo Jr., manager of corporate sales systems at The Torrington Co., a bearing maker in Torrington, Conn.

Corrections

*Because of an editing error in the Aug. 9 issue, the chart on page 16 was mislabeled. Commercial data processing makes up the lion's share of parallel processing.

IBM software chief resigns

Earl Wheeler, a 35-year IBMer and for the past five years general manager of IBM's Programming Systems business, will retire on Aug. 31. Stepping in as head of Programming Systems is Steven Mills, who has held various jobs at the division. Wheeler, 59, is heading to Hilton Head, S.C. Wheeler said he foresees no major reorganization of the division.

Feds award \$50 million in contracts

American Management Systems, Inc. (AMS), a software and services firm in Arlington, Va., won two information systems contracts with the U.S. Department of Defense that could amount to \$50 million over five years. One contract is with the headquarters of the Department of the Army for systems development and management. In the other, AMS will help the Defense Information Systems Agency centralize, standardize and streamline systems throughout the Defense Department.

CFO survey supports IS outsourcing

A survey of some 365 chief financial officers conducted by DePaul University's School of Accountancy found 60 percent planned to continue or increase IS outsourcing at their company. Cost savings is not the reason CFOs are smiling — access to expertise stood out as the greatest benefit of outsourcing, followed by concentration of management's attention on main business issues. Savings from staff reduction, software licenses and space reduction all rated lower.

Dealing with CA: The report

Saying it is responding to an undercurrent of unrest among customers of Computer Associates International, Inc., International Computer Negotiations, Inc., in Winter Park, Fla., has released a 20-page report titled "Dealing with Computer Associates." The \$795 report contains executive analysis of CA licensing policies, sales techniques and corporate organization and recommends specific tactics that customers should take to control the negotiating process. Chief recommendations: Get everything in writing.

They're ba-a-ack, at DEC

Several members of Digital Equipment Corp.'s original Alpha development team are returning to the company, including Jim Montanaro, Gary Hooper, Ray Steapham and Gerry Cheney. They will join Rich Wilek at the Palo Alto (Calif.) Design Center when it opens next month to focus on the development of low-power, low-cost Alpha AXP microprocessors for the mobile and wireless computing markets.

KnowledgeWare losses narrow

KnowledgeWare, Inc. posted fourth-quarter net profits of \$2.7 million, narrowing its fiscal 1993 loss to \$25.5 million. The loss was due in part to third-quarter restructuring charges. The Atlanta applications tools company earned \$2.3 million in last year's fourth quarter. Revenue for the fourth quarter ended June 30 was up 15% to \$40.4 million. Fiscal 1993 sales were \$126.7 million, up 9% from the year-earlier period.

SHORT TAKES AT&T and its NCR Corp. subsidiary have developed an agent that it said to allow Simple Network Management Protocol-based systems to manage AT&T's Definity Communications System line of digital private branch exchange systems. ... In the latest step in a pugnacious court battle, Microsoft Corp. asked a federal court to enjoin Stan Electronics, Inc., from selling its latest release of Stacker 2.1 for Windows and DOS, claiming it trade secrets.

DOD IS revamp at crossroads

New IS chief reaffirms CIM plan despite funding, CASE setback

By Gary H. Antles
WASHINGTON, D.C.

Lt. Gen. Emmett Paige Jr., the Pentagon's new information systems chief, said last week that despite apparent backpedaling, the U.S. Department of Defense (DOD) remains strongly committed to its mammoth systems modernization effort.

Paige, who was officially sworn in two weeks ago as assistant secretary of defense for command, control, communications and intelligence, said the concept behind the Corporate Information Management (CIM) initiative enjoys broad support among top civilian officials and military officers.

Asked about rumors that CIM is in danger of collapsing, former communications specialist Paige responded by tapping out in Morse code an eight-letter barnyard explosive.

Debits abound
Despite the reaffirmation, recent events have called into question the Defense Department's wholehearted commitment to the program — put together during the Bush administration which is intended to save billions of dollars through software standardization and reuse, facilities consolidation and business process re-engineering [CW, June 8, 1992].

Two weeks ago the House

Armed Services Committee recommended that Congress withhold \$315 million from the Pentagon's IS budget request for next year. The committee said the Defense Department had not presented a persuasive cost-saving plan for CIM, and, it said, "There are growing indications the department is moving to dismantle major portions of the initiative."

As acting IS chief, Paige, in June, received a September 1990 order to consolidate the software development facilities of the military branches under a new central agency. The decision was made in response to complaints that the consolidation would move application support too far away from users. However, he let stand an order to consolidate data processing facilities and reaffirmed an earlier commitment to reduce the number of legacy systems throughout the department.

In May, Deputy Defense Secretary William Perry signed a memo, drafted by Paige, that downsized plans for a huge initiative called integrated Computer-Aided Software

Engineering (ICASE). A cornerstone of CIM, ICASE was to have instigated a half-billion dollar purchase of CASE technologies that would become the standard tool box for the entire Defense Department. Instead, Paige said the procurement would be limited to pilot tests of CASE tools, worth perhaps only \$20 million.

"Over half the CIM program is being either enacted or implemented," said Paul Strassmann, CIM architect and former director of defense information. He said the decision not to consolidate the software activities will make it more difficult to achieve the standardized architecture and interoperability that are the heart of CIM. "They just went back to the status quo, without any plan," he added.

An official at the General Accounting Office (GAO), which is studying the issue, said the recent pullback is troubling.

"If you don't have centralized control of applications, the services are just going to go ahead and do what they have always been doing, and money is going to keep getting spent on redundant systems," said Frank Deffler, assistant director of the GAO's Accounting and Information Management Division.

Total haloncy

Strassmann labeled as "total haloncy" an assertion that CASE technology is not sufficiently mature to justify a huge Defense Department commitment at this time. "CASE was a very important part of the technological fix for CIM," he said. "But ICASE is crippled; it's being nibbled to death by bugs."

Deals Brown, former director of the Center for Information Management at the Pentagon, said there is a natural loss of momentum in big programs when top management changes, but he predicted that Paige would pursue the core concepts of CIM.

Brown said it was a good idea to move ahead with the data center consolidations while holding off on the software facilities, giving the military services "a chance to gain some acceptance of the concept of consolidation and to see that it can work and can save money."

On the warpath

Lt. Gen. Emmett Paige Jr. offered his thoughts on the following:

On the data standardization effort under CIM: "I'm told we don't have a single data element standardized in all of DOD. I will not accept that as an answer."

On the importance of business process re-engineering: "If I were president, I would just issue an executive order. That should do it."

On Defense Department-wide migrations: "I do not favor the large procurements like Desktop IV. I'd prefer to see the military departments given the authority to do their own procurements."

On mainframes: "We hope to migrate away from mainframes. Client/server will stand quite well" for new applications while mainframes remain for the legacy applications.

On the DOD's Ada mandate: "Ada is not dead. I don't intend to kill the Ada mandate, and I don't intend to let Ada stagnate."

On computers at the Pentagon: "I hate to tell you what I'm using. Office automation at the Pentagon is the worst. I have ever seen."

—Gary H. Antles

GTE names Systematics sole outsourcer

By Jean S. Bozman
ATLANTA

GTE Corp. is consolidating multiple contracts for data center services, back-office support and software development into one outsourcing contract.

GTE's \$4 billion Telecommunications Products and Services Group said last week that it will consolidate two outsourced data center operations that separately handle bill processing for its Contel Cellular, Inc. and GTE Mobility, Inc. cellular customers. The data centers also provide processing cycles for several outside software development groups.

Systematics Telecommunications Services, Inc. in Little Rock, Ark., a \$579 million outsourcing firm owned by cellular provider Alltel Corp., gained the 10-year GTE outsourcing contract for an undisclosed sum. The billing system will track the accounts of 1.3 million GTE cellular telephone customers.

"Systematics is offering us a complete front-end to back-end billing service, and we think we will benefit from economies of scale," GTE spokesman Jeff Ketter explained.

GTE will enhance Systematics' Virtuso billing and customer service system to

support GTE's cellular business. Virtuso is used by Alltel, three Canadian companies and two small U.S. firms.

George Kerns, assistant vice president of cellular information management operations, said the consolidation was planned when GTE acquired Contel in 1991. Most traditional information systems functions for the \$1 billion cellular

business unit have already been outsourced. "We're looking to drive down information systems costs as a percentage of revenue," Kerns said.

Kerns' 190-person information management staff will handle systems design and analysis for GTE's cellular business. "Our [information management] group will always be the interface between the

business operations and the outside vendor," he said.

Staffers at other GTE units in New York and Dallas that handled the former cellular billing contracts will be redirected to other projects or join Systematics.

The transition to a merged back-office operation could take 12 to 18 months as Contel's billing applications are hosted on Digital Equipment Corp. VAXes and must be converted to run on IBM Application System/400s and mainframes.

Borland loses macro round in copyright suit

By Mitch Betts
BOSTON

A federal judge ruled late last week that a key compatibility feature in Borland International, Inc.'s Quattro Pro spreadsheet software that allows it to run user-written Lotus 1-2-3 macros infringes on Lotus Development Corp.'s copyright.

Borland characterized the ruling as a "broadside attack on consumers' rights to use compatible software products," but Lotus said it merely means the "macro key render" in Quattro Pro is illegal.

Quattro Pro users with 1-2-3 macros are not in any legal jeopardy because they did not copy the software feature, said J. T. Westermeyer, a partner at Fenwick & West in Washington, D.C., and an expert on computer law. If the decision stands, Borland will have to pay damages and either remove the feature or replace it with a noninfringing equivalent.

The ruling by U.S. District Court Judge Robert E. Keeton was the last in a series of pro-Lotus decisions in the suit filed in 1990. Borland called it an "unprecedented overexpansion of copyright law" and said it plans an immediate appeal.

"Most legal commentators believe Judge Keeton has gone a little too far in pushing the copyright edge," Westermeyer said.

Borland said last week's decision means users cannot use their own 1-2-3 macros in non-Lotus products. But Lotus denied that statement and said Borland is trying to sow confusion.

AN/WAN LAN

UDS is Fully Focused on Digital Datacomm

In the accelerating transition from analog to digital datacomm, only UDS has a full line of switched digital devices that communicate across all predominant access technologies (ISDN, Datapath, Switched DDS).

Products are fully developed and ready for shipment to datacomm users whose systems utilize DDS, switched digital, T1, fractional T1, ISDN or any combination of these advanced communications technologies.

UDS digital products include multi-rate DSUs/CSUs with speeds to 56/64 kbps, DSUs/CSUs for T1 and fractional T1 applications, frame relay, statistical and time-division multiplexers and a broad range of ISDN terminal adapters and network termination units.

Standalone models of UDS digital datacomm products are easily convertible for space-saving, rack-mounted installation in UDS Data Shelf™ enclosures.

Unlike other manufacturers who offer narrow product lines for limited applications, UDS offers a full migration path to all-digital networking.

For complete product information and help in configuring your digital datacomm system, call

Sparks fly in C++ development battle

By Melinda-Carol Ballou

Microsoft Corp. and Symantec Corp. will up the ante in the C++ war when they officially unveil their 32-bit development environments. Borland International, Inc., meanwhile, is quietly preparing a counterattack that targets Microsoft with a 32-bit version expected to ship this fall, industry sources said.

Users praised the competition, saying it can only improve the quality of the tools.

New with the 32-bit edition of Microsoft's Visual C++ are the following features: debugger support for multithreaded applications and for Windows NT-style exceptions; Win32s libraries to run applications on Windows NT or on Windows 3.1 and an integrated profiler.

The 32-bit version of the product is "almost identical" to the 16-bit version in other ways, and moving applications is straightforward, a beta-test user said.

However, controls available with 16-bit Visual C++ and with Visual Basic have

not yet been ported, he said. Other users criticized the lack of exception-handling and templates with both Microsoft Visual C++ and versions.

"Exceptions are really important because what happens if the application fails?" asked Don MacDonald, informa-

Symantec's C++ Professional 6.0 is compatible with Microsoft Visual C++ and Borland Application Frameworks 3.1, enabling users to migrate their applications. It supports Microsoft Foundation Classes with its C++ compiler for 16- and 32-bit code generation and offers the Win32s system hosted on Windows 3.1.

Three versions of the Symantec environment are available for different expertise levels. The product includes an integrated development and debugging environment and multiple independent views of the applications, as well as a graphical user interface to Intersoft Corp.'s PVCS version control software, visual prototyping and code-generation tools and a linker.

Borland C++ for Win32s will offer full C++ exception handling and ObjectWindows 2.0, an application development framework for Windows and Windows NT that will include high-level controls and visual tools and ObjectWindows Class Library 2.0. Sources said Borland

is talking to other C++ vendors (excluding Microsoft) to allow ObjectWindows applications to be portable across multiple compilers, as are Symantec's and Watcom's.

The implications of the C++ battle go much further than a tit-for-tat fight over features to include the wider industry conflict over future operating systems.

Whichever vendor controls the development environment will control the operating system, and therefore, Visual C++ makes it very easy to get into the Windows environment and much more difficult to get off, said Michael Schneider, a vice president at Gartner Group, Inc., a consultancy in Stamford, Conn. "What Microsoft is hoping is that Visual C++ users will remain married for life to Windows and Windows NT," he said.

Borland, Symantec, Watcom and Microsoft support a greater range of operating systems than Microsoft (see chart). Borland also describes a more generic windowing environment with its class libraries. This is attractive to users seeking greater independence from Microsoft, but others want the close affiliation with Windows.

The desktop mix						
	OS/2	VMS	Windows 3.1	Windows NT	Apple	System 7
BORLAND	X	X	X	X		
MICROSOFT	X	X	X	X		
SYMANTEC	X	X	X	X	X	X
WATCOM	X	X	X	X	X	X
= EXTENDED 32-BIT				= Win32s		

tio systems officer at Chemical Banking Co. in New York. "We need to be able to throw an exception in and get the machine back to a stable state."

Other tools, including those from Symantec, Borland and Watcom International, Inc., offer support for templated. Watcom also does exceptions.

Whither wireless security?

CONTINUED FROM PAGE 1

Because all methods of wireless data transfer are accomplished by devices that are essentially radio transmitters, anyone with the right receiver can tune into your voice or data transmission. "Ask Princess Diana how problematic it can be if someone is taping into your phone conversation," Geisler said.

Grabbing data out of the air can be a simple task. For about \$1,000, a voice and data traffic monitoring system can be set up using the Itron Corp. R7000 receiver and Advanced Electronic Applications, Inc.'s Packrat decoder, according to Bob Hatter, retail manager at the Electronic Equipment Bank in Vienna, Va.

Hatter sells the settop to shortwave radio operators and reminds them of the illegality of abuse. "People shouldn't be out there vacuuming the atmosphere looking for every scrap of information about everyone," he says.

Security experts said the best way to safeguard sensitive data—whether it is transmitted over the airwaves or not—is to encrypt it. "It doesn't matter if someone can pick up your signal if they can't read it," said David Frankland, vice president of Digital Ocean, Inc., a wireless products provider in Overland Park, Kan.

Still, users should proceed cautiously. "Don't kid yourself: You've

not going to duplicate the type of security you have on a mainframe," said Tom DeNald, manager of special development at Masterdata International, Inc. in St. Louis, who is encrypting data sent via wireless devices.

Within a local area, infrared and spread spectrum are the most common methods of wireless connectivity. Both broadcast only a short distance, so an eavesdropper has to be close. Control the perimeter flow within a transmission zone and you effectively control who sees the information. "It's not quite as strict, but it's workable," Geisler said.

Safe and scattered

The nature of spread-spectrum technology requires the data transmitted to be broken up and spread over a range of radio frequencies, rather than broadcast at a single frequency. The data is then reassembled at the receiving end. Some spread-spectrum network vendors claim it is technologically more difficult to decode a spread-spectrum broadcast than it is to read encoded network packets transmitted through traditional cabling systems. That is because the signals are scattered over many frequencies and have to first be decoded, then reassembled for the data to make sense.

Communications strategies that involve a network carrier—for example, cellular phone net-

works—are also fraught with danger. Although illegal, many people scan the cellular frequencies and listen in on voice frequencies in the same way people scan police and fire frequencies.

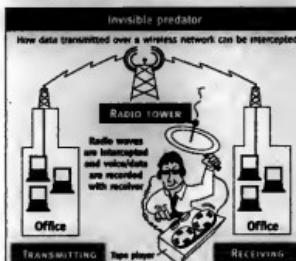

Radio ID

Some companies are exploring other options, such as the Aegis packet radio data network, which is widely available throughout the U.S. This type of network identifies each radio by its unique identification number and only connects with packet radio stations on the user's authorization list.

In addition, the radio transmission is broken up into data packets that the system reassembles back into a meaningful data stream. Because these packets may arrive intermixed with those from other subscriber units, it makes random interception of data substantially more difficult, Geisler said.

But there's a downside: The randomness of the arrival of the data packets can give slow response time when using an application online. Cellular transmissions can also be noisy and cause data errors or prolong the connect time.

Ultimately, wireless security awareness must be emphasized at an end-user level. "Users need to take control of their own environment by encrypting data and making sure that they take safeguards in its transmission," said Fritz Wagner, manager of corporate electronic information security at DuPont Co. "The 15 guys can't do it all."

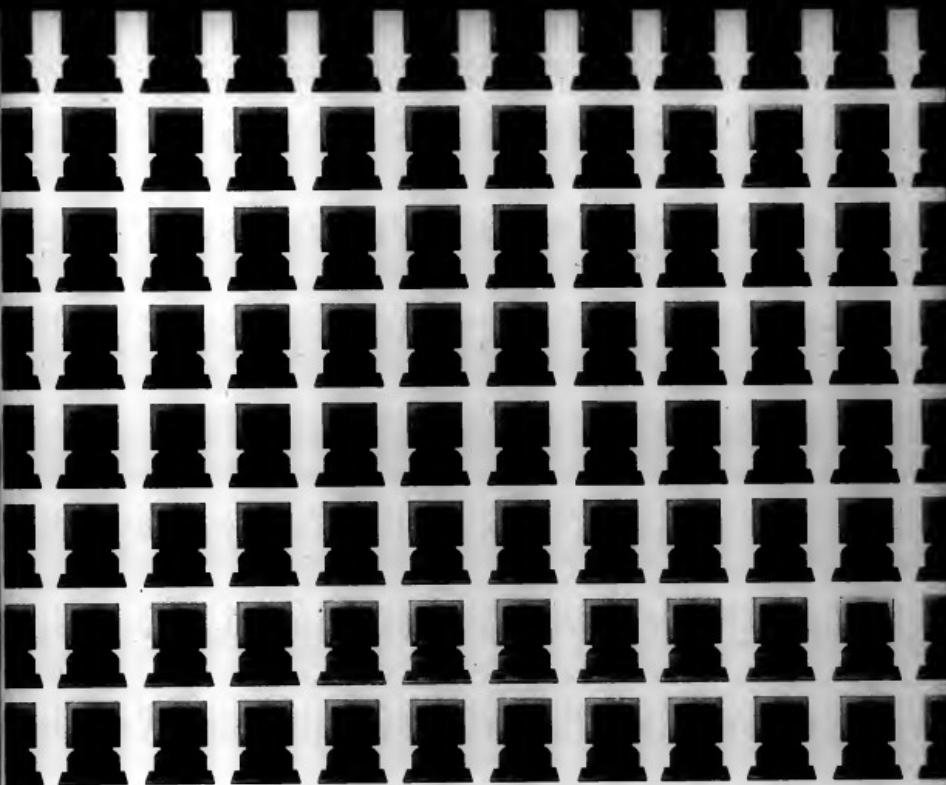

Worry-free wireless?

Dennis Wallenck does not think much of the theory that wireless data transmission is inherently more dangerous than traditional land-line methods. At least he is not going to stand in the way of a good thing.

"It's not like we're transporting state secrets," said Wallenck, the vice president of information systems at Dry Storage Corp. in Des Plaines, Ill. Wallenck has 200 trucks with handheld wireless machines from Telxon Corp. that dispatchers use to keep tabs on the whereabouts of goods being trucked across the country.

Physical protection is their only form of security, but Wallenck does not seem to mind. "The advantages are too great to be habited by the possibility of what might happen," Wallenck said. In fact, he claims that a wireless network can be more secure than a land-line system. "Wireless is a lot less susceptible to the casual hacker," he said. —James Daily

WE'VE JUST CREATED THOUSANDS OF NEW REASONS WHY IT'S A GREAT TIME TO BUY A COMPAQ DESKPRO.

And they're all available right now. The COMPAQ DESKPRO/i, the DESKPRO/M and a wide array of COMPAQ Monitors. Not only have we boosted production, but we've enhanced video performance by

up to 45%. And now get great savings. Call your COMPAQ Reseller and ask about the Total System Promotion. Or for a reseller near you call 1-800-638-8258 ext. 560. There's no reason not to.

COMPAQ

Sybase tool set

CONTINUED FROM PAGE 1

it looks like we can, we'll probably move back," he said.

Windows support is key for Chevron, Soper said. Sybase's unification plan includes a Windows-compliant graphical user interface builder to update character-based APT Workbench applications.

Sybase is also expected to do the following:

- Link Delphi front-end modeling and design tools to application generators from computer-aided software engineering makers such as Texas Instruments, Inc. and Intersolv, Inc. by publishing application programming interfaces.
- Extend object-oriented functions with a product, code-named Calypso, designed to add front-end analysis, design and modeling features to recently acquired

object-oriented tool GainMomentum.

- Offer re-engineering functions to help users reverse-engineer existing Sybase applications into a central repository. The programs could then be regenerated into object technology.

Sybase declined to comment on the upcoming announcement, but a spokeswoman acknowledged that pieces will be released in phases until the end of 1994. GainMomentum 2.0, which shipped last month, is the first component.

However, at least some terrain that Sybase has allowed third parties to take is likely gone for good.

United Grain Growers Ltd. bought \$200,000 worth of Powersoft's PowerBuilder application at the behest of Sybase.

"I see no logical reason to switch now," said Terence Light, manager of systems development. "We're committed to PowerBuilder." The Winnipeg, Manitoba, agricultural firm is in the middle of a \$2 million client/server project anchored by Sybase's SQL Server.

Nevertheless, ballooning demand for toolkits leaves enough room for Sybase, analysts agreed. Development aids are like cars, according to Herb Edelstein, principal at Eustis Associates, a consulting firm in Potomac, Md. Each has its own unique strengths, and no single product is "right," he said.

Sybase's overarching strategy is similar to Oracle Corp.'s Cooperative Development Environment in that both plans cover soup-to-nuts development, said David McGovern, president of Alternative Technologies, a consultancy in Boulder Creek, Calif. "Presumably, these tools from database companies will be more integrated with databases than those from third parties," he said, "but that remains to be seen."

Meanwhile, Oracle lacks an object-oriented counterpart to Sybase's GainMomentum, Edelstein noted. "Gain gives them a real step up."

EVOLUTION

...with definitive answers to your questions. An evolutionary approach, the step-by-step strategy moves organizations into the world of Client/Server smoothly, with minimal risk. You can enjoy the cost savings and efficiency benefits of today's new technology solutions for Supply Chain Management including Manufacturing, Logistics/Distribution and Operations/Finance. 'Windows first'

In what it acknowledged is a "change of direction," Oracle plans to ship a complete set of Windows-based development tools before it ships Unix versions of comparable products.

Windows editions of all the dozen or so tools under Oracle's Cooperative Development Environment (CDE) banner, announced in March, are in production except for two: SQLForms and Oracle Designer. They are scheduled to ship before Oracle's user conference at the end of next month, said Dennis Moore, director of CDE product marketing.

CDE is an umbrella term Oracle coined for a set of 14 existing and new application development tools.

Oracle's "Windows first" attitude is an attempt to appease Oracle database users who are looking to build Windows-based client/server applications, said David McGovern, president of Alternative Technologies in Boulder Creek, Calif.

Also at the user show, Oracle is expected to announce Microsoft Windows NT versions of SQLForms and other tools; however, Moore declined to comment.

—Kim S. Nash

You're closer to Client/Server than you think.

There are plenty of choices of GUI builders, plenty of choices of databases, there are even choices of cross-platform communications, but Micro Focus is uniquely qualified to provide complete client/server solutions for your industrial-strength applications today.

The **Micro Focus Client/Server Solutions** encompass an open framework allowing you to choose Micro Focus' best tools for tasks

such as building graphical user interfaces or handling program to program communications.

Or, instead, plug in the tool-of your choice.

Whether you are building applications

with distributed data, distributed application code or distributed presentation services, the

Micro Focus Client/Server Solutions provide middleware components so developers need only know how to plug into the appropriate platform.

Micro Focus Client/Server Solution is right for you. No matter what mix of thin or thick clients, or thin or thick servers, you will find it all in one place. And, best of all, the Micro Focus Client/Server products provide a bridge from the old to the new, leveraging existing resources with the latest technology.

For a brochure on the **Micro Focus Client/Server Solution**, call **800-872-6265**. Discover how Micro Focus delivers "*A Better Way of Programming*".

Cisco changes SNA strategy

CONTINUED FROM PAGE 1

generally available, at a price many vendors call reasonable.

This step was "the death knell for APPN" because it finally quieted vendor fears that IBM would exact huge financial levies from third-party APPN providers, said James Tretter, a telecommunications manager at MultiCommodities in Minneapolis.

Vendors' hands tied
IBM's licensing arrangement effectively throttled APPN in a much

more direct way because it forbids vendors from enhancing or significantly changing the APPN protocol without IBM's approval, said Cisco SNA product manager Michael Zadikian.

Cisco originally announced its intention to build APPN without using APPN patents; later, however, it acknowledged that certain key capability demanded by users, such as interspersing between APPN and APPN nodes, would require the use of APPN codes.

Another key IBM move toward APPN openness has been the creation of the APPN Implementors Workshop, a forum that allows vendors to participate in the development of APPN enhancements, according to IBM. Vendors also receive APPN enhancements, such as High Performance Routing, in time to compete effectively against IBM's own APPN offerings.

Chevron originally hoped to see the APPN Forum provide this type of free interchange around SNA internetworking; however, that hope was dashed when IBM did not join the forum, Vandell said. Now, IBM seems to be "working legitimately and honestly with vendors" within the APPN Implementors Workshop, she added.

Overwhelming support
Vendors have shown their belief in the sincerity of IBM's perseverance by rushing to support APPN on their products (see story at right).

Some big users, too, are plan-

ning to give APPN a much closer look now that it seems to be turning into something like a true industry standard.

"We have no need for a protocol like APPN now, but we will as we move into more distributed systems and Application System/400s," Vandell said. However, what the company really wants IBM to provide is a seamless way to support SNA and TCP/IP, possibly through its upcoming Asynchronous Transfer Mode (ATM) products, she added.

"We are really excited about ATM and may move to it without going to APPN first," Vandell said.

Indeed, many users are still looking to run SNA over their TCP/IP backbones rather than using APPN, however open. MultiFoods, for example, uses APPN to interconnect its AS/400s, but it has no plans to implement the protocol on its routers, Tretter said. "For routing, we just use frame relay, and our Wellfleet routers encapsulate SNA on top of IP," he explained.

Cisco hopes to announce router support for IBM's APPN Network Node around the second half of next year, as was originally announced in a statement of direction a year ago, Zadikian said.

The router vendor said it will propose to the APPN Forum that it either halt development on APPN or further pursue the opening of APPN. Meanwhile, Cisco will work with a vendor group within IBM's APPN Implementors Workshop to develop an industry standard based on IBM's Data Link Switching protocol, Zadikian said. Cisco announced plans to implement the forthcoming standard on its routers by mid-1994 (CW, Aug. 9).

NetWare 4.0 NetWare Directory Service, enabling client systems to address IBM Logical Unit names, host and application names and specific data links from other LANs across the enterprise, Machi said.

The new release will also support IBM's Advanced Peer-to-Peer Networking (APPN) End Node, which will allow the gateway to automatically connect LAN clients with resources across an APPN network, Machi said.

Novell expects NetWare for SAA to bring in \$90 million in revenue for fiscal 1993.

Next week at the Interop '93 August show in San Francisco, the vendor will announce an NLM that acts as a LAN gateway to Digital Equipment Corp. hosts, according to Machi. Scheduled for November shipment, the product will accept Transmission Control Protocol/Internet Protocol, Apple Computer, Inc. AppleTalk and Novell's IPX traffic, and it will route it into DEC's Local-Area Transport client-to-

Novell expands host gateway strategy

By Elisabeth Horwitt
PHOTO BY STAN

Novell, Inc. is preparing several initiatives designed to significantly expand the capabilities of NetWare for SAA, a NetWare Loadable Module (NLM) that provides local-area network clients with connections to the full range of IBM hosts.

Novell will announce a more enterprise-oriented version of NetWare for SAA in the first half of 1994, said Gerry Machi, vice president and general manager of Novell's interspersing group. The new version will scale up to support thousands of sessions, in contrast with the current product's 500-session limit.

It will provide more integration with Novell

Fibre Channel switches into high gear

By Ellis Booker

Lawrence Livermore National Laboratory in Livermore, Calif., last week said it has deployed the first working prototype of the Fibre Channel implementation developed by Hewlett-Packard Co. and San Microsystems Computer Corp.

Fibre Channel supports bidirectional data speeds of up to 1 Gbit/sec. over distances of up to 10 km.

use Fibre Channel to connect a wide variety of computers, ranging from workstations to supercomputers.

Currently, some of the lab's most complex simulations require 160M bytes of data to be transferred from a supercomputer to a workstation, a process that takes up to 40 minutes over the center's Ethernet. The prototype Fibre Channel will reduce this to eight minutes; when full gigabit speeds are supported under Fibre Channel, this will be reduced to a mere two seconds.

Fibre Channel supports bidirectional data speeds of up to 1 Gbit/sec.

Vendors eager to hop on board

Was IBM's APPN and Data Link Switching (DLX) protocols rapidly moving toward industry-standard status, a horde of networking vendors are support of these protocols as a powerful interspersing of SNA internetworking possibilities.

Announcements include the following:

• Cisco is adding, including all major router vendors, have announced plans to support APPN, which provides interspersing and routing and directory protocols for internetworking coexisting across a peer-to-peer SNA network.

• Next week at the San Francisco Interop '93 August show, 13 vendors will demonstrate how their products can communicate via a multi-node APPN network. Princeton Systems, Inc., IBM, Systems Strategies, Inc., and ECOS Corp. products will run APPN protocols in the dozen. Other participating products will assess the network via IBM's LAN 2 and T2.1 peer protocols, an IBM spokesman said.

• Support for APPN End Node will be part of the next release of NetWare for SAA, Novell, Inc.'s LAN-to-host gateway product, according to Gerry Machi, vice president and general manager of Novell's interspersing group. The product is due out in the first half of 1994. Novell will participate in the APPN demonstration next week.

• Proteon last week said it will ship in the first quarter of 1994 a product based on DLX, IBM's protocol for routing SNA and NetBIOS over TCP/IP. Proteon plans to implement APPN Network Node on its routers probably sometime in 1995, a company spokeswoman said.

• ECOS is slated to ship an APPN End Node product by year's end.

• Sync Research, Inc. plans to announce late this year or early next year an APPN End Node product that will allow PCs on a LAN to participate in an APPN network without needing to run either APPN or T2.1 protocols, according to Sync Research Chief Executive Officer John Rademaker.

• Microsoft Corp. said it will release a software development kit for its SNA server for Windows NT at the Interop show.

—Elisabeth Horwitt

 SYBASE®

A man's face, partially obscured by shadow.

The first step in business success.

The second step is to succeed.

The third step is to succeed.

The fourth step is to succeed.

The fifth step is to succeed.

Business processes. Business

processes. Applications. And maybe

most importantly,

When Bob Epstein, Executive Vice President and a founder of Sybase, talks about computing and business, people listen. After years of developing client/server products and talking with customers, he's seen what works, and what doesn't. Hear what he has to say in a remarkably candid recorded conversation. For your copy of "Client/Server And The New Organization," call 1-800-SYBASE-1.

**Reporter's
Notebook**

American Airlines is in the midst of a project to expand its Galleon airline reservation system. It plans to allow customers to make airline reservations using fax machines or PC systems running E-mail. After making the reservation, users will receive their itineraries either by fax or E-mail, said Sabre President Terrel Jones.

One of the more interesting observations to come out of the panel discussions at Groupware '93 last week was from Sheldon Louis, national director of information technology at Fries Waterhouse. "With groupware, we're basically trying to reinvent the wheel. Mainframes always had groupware, but the PC companies are presenting that they invented the entire idea and that no one else has done this before," Louis said.

But then again, even companies like DEC are jumping on the groupware bandwagon. DEC announced last week that it will develop and market groupware applications based on the Virtual Notes book System (VNS) from The FireFront Group in Minnesota. VNS is a distributed client/server application for Windows and Macintosh systems that supports real-time groupware activities using a document metaphor.

FireFront also announced that its software can run simultaneously with a videoconferencing application from ViewPoint Systems in Dallas.

Meanwhile, imaging companies are starting to join the groupware race. Last week, Imagery Software, a unit of Eastman Kodak that makes imaging software used by Lotus and Novell, announced a \$20 stand-alone PC application that can also be linked to imaging server applications. At the same time, SoftSolutions Technology Corp. in Orem, Utah, announced that it will support imaging software from Watermark Software in Burlington, Mass., in its document management software package.

Apple offers groupware preview

Will embed E-mail services into operating system

By Michael Vizard
SAN JOSE, CALIF.

Looking to leverage a Macintosh graphical interface that is tightly integrated with the System 7 operating system, Apple Computer, Inc. last week outlined a groupware initiative at Groupware '93 that it intends to launch in the next few weeks.

Consisting of what company executives described as PowerTalk services and PowerShare servers, the Apple groupware effort seeks to directly layer several system services, such as electronic mail and shared directories, into the System 7 operating system.

Ultimately, these services will be layered on top of other environments, including Windows, they said.

This approach differs dramatically from Lotus Development Corp.'s Notes effort in that Notes is a separate database with

which applications must be integrated, said Gursharan Sidhu, technical director for collaborative systems at Apple.

In contrast, the Apple strategy, which is part of the company's Open Computing Environment architecture, calls for deploying a universal mailbox in System 7 that supports multiple E-mail systems. Each user will be able to click on an icon to access any of the mail systems, which will include systems from Apple, Novell, Inc. and Microsoft Corp. as well as X.400 and fax support, without having to have a separate log-on and directory services for each mail transport.

"Users will have a single log-on password through which all system services will be addressed," Sidhu said.

Personal directories

In addition to the universal mailbox, Apple will allow users to create individual catalogs, otherwise known as directories, that contain specific types of documents and

forms and SQL databases.

Lotus has already implemented a document-centric architecture that can be used to incorporate PC applications inside Notes discussion databases complete with bidirectional replication in the Notes databases. But users and resellers said Lotus is missing an opportunity to lock up the market before Microsoft can get started.

To fend off Microsoft, Lotus must focus on providing more robust development tools for Notes in short order. Most of the Notes applications are relatively simple applications tied to discussion databases. Lotus is expected to resolve this problem through alliances with third-party tool developers and the creation of a graphical user interface development tool, dubbed Notebook, expected later this year.

On your mark

The Competition: Playing by the rule to success. CW Correspondent, director advertising for IBM, addressed the pricing concerns of the surveyed executives, who claimed Cusp for a single license was more than the price of other Windows applications.

"Cusp is a great and fair price for a software product that has demonstrated a 40% consumer return on investment," he said.

Notes leads, but flaws cited

CONTINUED FROM PAGE 1

Currently, Notes has a list price of \$495 and a street price of about \$280. Resellers note that when you add the cost of Notes to the cost of an application built on top of it, along with the installation and ramp-up costs, the total cost of a Notes installation can be prohibitive.

Lotus contends that Notes is currently positioned to compete with other PC applications and databases.

But analysts and users said this strategy is misguided.

"Lotus is applying a PC model to an IS issue. They are a desktop vendor moving up the curve into a territory that used to be dominated by IBM. As such, they are still experimenting with the pricing and channels," said Dave Marshak, an industry analyst at the Patricia Seybold Office Consulting Group in Boston.

Lotus, meanwhile, hopes to resolve some of the Notes integration issues by pressuring IBM to support Microsoft Corp.'s Object Linking and Embedding (OLE) API, said Lotus Chief Technology Officer John Laundry. "We want IBM

to support OLE and the Windows API to minimize the impact of supporting OS/2. Right now it's a hard port," he said.

Scalable mailing

Lotus this fall will update v2.2 Release 4 with support for the Application Field Lettuce facility used to integrate applications in its office suite with its Notes environment.

Using v2.2 Release 4 with its office suite will give Lotus a short advantage over rival Microsoft. That advantage is likely to be overtaken when Microsoft releases Office Version 4.0 at year's end, which is expected to include a suite of applications that support OLE Version 2.0. Lotus, meanwhile, is expected to support OLE 2.0 sometime next year.

As for integrating with Unix applications, Ray Ozzie, president of Iris Associates, a Westford, Mass., engineering firm that builds Notes for Lotus, said that while Unix has some OLE-like facilities, the differences in those facilities make it difficult to integrate Windows applications with Unix applications.

Rivalry heats up
Many observers gave Lotus an 18-month lead over its nearest competitor, Microsoft, mostly because Microsoft's groupware strategy relies heavily on undelivered products.

Among the key components of Microsoft's groupware strategy are a document-centric implementation of Windows 4.0, an electronic-mail server based on an object database running on Windows NT (see story page 15), and replication services that will be included in its E-mail systems, file sys-

tematic. These directories can then be accessed using icons and a series of templates that Apple will provide.

Apple will also add a mailing label to all documents to make it easier to send documents, and any document sent through the system will be automatically encrypted.

On the server side, the Apple strategy calls for deploying two PowerShare servers, one of which handles E-mail; the other is described as a catalog server. This latter server will support replication across distributed servers, will include indexes to make it easy to find documents in catalogs and will support multilanguage translations of documents, time synchronization and RISC security.

Initial reactions to the Apple strategy have generally been very positive. "What Apple is doing is excellent. I always thought the Macintosh was a real competitor," said Michael Young, a consultant at Computer Sciences Corp., who is working on projects at Brooks Air Force Base in Texas.

According to Young, Windows is currently the dominant platform at Brooks, but he expects the new capabilities in System 7 will get some units to shift to the Macintosh.

Objects pitched to simplify E-mail management

By Michael Vinard
SAN JOSE, CALIF.

Microsoft Corp. and Lotus Development Corp. are getting their respective houses in order as they move to client/server electronic-mail systems that will rely heavily on object technology.

The basic idea behind the object-oriented systems is to simplify administration headaches that have long been the bane of information systems directors coping with different E-mail protocols.

Meanwhile, some users and they are losing patience with the dogfights between the Vendor Independent Messaging (VIM) coalition led by Lotus and Microsoft's Mail Application Programming Interface (MAPI) proponents, and are taking different tacks to solve the problem.

"The users should be seated in a room until there come to an agreement," said Art Beckman, manager of information technology services at Pacific Gas & Electric Co. (PG&E) in San Francisco. "Without an agreement, the users are taking it in the shorts and the vendors are losing some."

Until some accord is reached, however, the vendors are going their separate ways. According to industry sources, Microsoft is expected to deliver its promised Electronic Messaging Server (EMS) in the second quarter of next year. This server offering, which will run on top of Microsoft's Windows NT, will use an object database to tie any MAPI-compliant front-end mail system into EMS.

The goal is to use object technology to make it easier to add users to a heterogeneous network of E-mail systems. Simply pointing and clicking on an object will update a directory service that is shared by MAPI-compliant front-end mail systems.

Meanwhile, Lotus is continuing to pursue a course that calls for the integration of CC:Mail and Notes Mail under a common transport. Under this evolving strategy, Lotus plans to use Notes Mail, which has a client/server architecture, as the primary back-end service, while giving users a choice of CC:Mail, Notes Mail or other VIM-compliant front ends.

Ultimately, Lotus will build an object database on top of the Notes Mail service, said Jane Eisenberg, senior product marketing manager at Lotus.

Trend toward object-oriented
In the meantime, vendors are advising customers and other developers to write to the object-oriented versions of their respective application programming interfaces to prepare for the future.

Managing multiple E-mail systems remains problematic. Beckman said his company requires all mail services to be compatible with the directory services in the Vines network operating system from Bayany Systems, Inc. However, if there was a common mail transport, he might open PG&E to other mail products. For similar reasons, Price Waterhouse

decided to replace CC:Mail with Notes Mail when it moved to Notes, and American Airlines has decided to deploy WordPerfect Office 4.0 rather than wrestle with multiple E-mail systems.

According to Terri Jones, president of American's Sabre Computer Services, WordPerfect Office will be deployed on multiple platforms in place of 6,000 HP

Desk licensees, 3,000 IBM Professional Office System licensees, 4,000 Microsoft Mail licensees, 500 CC:Mail licensees and 300 VM/OS/2 licensees.

But while these IS directors apparently have the clout to enforce standards at their own companies, most IS shops are expected to wrestle with multiple E-mail systems far into the future and will likely have to wait for the next generation of object-based E-mail systems to resolve the administration issues.

FREE TUNING GUIDE!

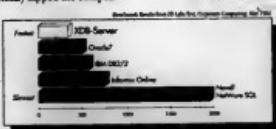

Count On XDB For Your Client/Server Database Solution.

Self-service

Some IS shops are taking object-oriented E-mail into their own hands. Waste Management of North America in Lombard, Ill., is building an object database on top of an E-mail gateway from Soft-Switch, Inc. in Wayne, Pa.

1 Performance

When *Corporate Computing* reported the results of a recent 2D Lab benchmark study, they rated: "XDB-Server amazed us. It virtually lapped the competition.... XDB ran over 50% faster overall than either Oracle® or DB2/2. And, for complex queries, the difference soared to 80%. When it comes to performance benchmarks, XDB beats every contender hands down."

2 Compatibility

XDB supports 100% of the features you value in DB2 — Oracle doesn't, and neither does DB2/2. XDB lets you downsize to client/server and keeps your data consistent across platforms. XDB has long been the standard for DB2 development on the workstation. Now in our latest version... XDB provides a powerful production client/server RDBMS solution to make your server really run like a mainframe.

	XDB	ORACLE7	DB2/2
DB2 System Catalog Tables	YES	NO	NO
DB2 Storage Architecture	YES	NO	NO
DB2 Distributed Access Using 3-Tier Names and ALIAS	YES	NO	NO
Concurrent Referential Integrity	YES	YES	NO
Read-only Shared Databases	YES	NO	NO

In a client/server environment, you need a client/server database solution that delivers top-level performance. You need a good fit. And, you need to be able to work with existing data. Two out of three isn't good enough for your mission-critical systems. XDB Systems is the only company with a client/server RDBMS

solution that you can count on to deliver all three.

XDB Systems gives you the performance, compatibility, and connectivity you need.

News Shorts

LAN meets WAN in switch-

LightStream Corp., a joint venture between Bell Atlantic and Nortel Networks, and Ungermann-Bass, Inc., last week unveiled what analysts said is the first integrated local- and wide-area network backbone Asynchronous Transfer Mode (ATM) switch to reside in a single box. The switch, with throughput of up to 20 Gbytes/sec, is due late next month.

CSC wins software deal at Rockwell.

Rockwell International Corp. has awarded a \$3.5 million contract to Computer Sciences Corp. to install a common Unix-based ordering and logistics system across Rockwell divisions. Rockwell uses a variety of incompatible mainframe-based parts-numbering and tracking systems.

Third-party tools arrive for Borland

Users of Borland International, Inc.'s InterBase database no longer have to rely on Borland for compatible development tools. New York-based Jyace, Inc. announced last week JAM/Database Interface for InterBase, a tool set that runs under Windows and DOS. The product was designed to let users build PC applications that can access data on Unix or VMS servers running InterBase Version 3.3 or higher. A DOS version costs \$990; a Windows edition sells for \$1,750.

Management software is upgraded

Cabletron Systems, Inc. has announced Version 2.0 of Spectrum, its enterprise network management platform. Included is a feature that allows users to export management data from the Spectrum database so SQL environments and spreadsheet applications such as Lotus Development Corp.'s 1-2-3 can use the data in graphs and reports. The company also announced Spectrum for Open Systems, which is said to enable leading Simple Network Management Protocol-based management platforms such as Hewlett-Packard Co.'s OpenView and Novell, Inc.'s NetWare Management System to manage Cabletron hubs.

Cisco profits soar for Q4, year

Internetworking vendor Cisco Systems, Inc. last week posted fourth-quarter net profits of \$35.7 million, a 97% increase over the corresponding period last year. Revenue in the period ended July 25 rose 80% to \$255.2 million. For the year, Cisco earned \$171.9 million on sales of \$640 million, increases of 104% and 91%, respectively.

Unisys, disk drive maker settle lawsuit

Unisys Corp. has settled its copyright infringement lawsuit against Macro Computer Products, Inc., a Rochester Hills, Mich.-based computer disk drive manufacturer and reseller of used Unisys equipment. Under terms of the settlement, Macro has agreed not to use unregistered Unisys products, to license all software for Unisys computers it uses and to return or destroy all proprietary Unisys information and software in its possession. Additionally, Macro made an undisclosed payment to Unisys.

SHORT TAKES Molex Computer Corp. said last week it started shipping three classes of Sun Microsystems, Inc. SPARCstation 10 machines, priced from \$6,995 to \$10,995... NCR Corp. this week will throw its hat into the ring of aspiring ATM vendors. The company's forthcoming ATM products will focus on optimizing local- and wide-area bandwidth for data, video and voice transmissions at speeds reaching 2.2G bytes/sec.... IBM is suing Counter Peripherals, Inc. for infringement of nine IBM magnetic disk storage patents.

Peer LANs target big business

Vendors push reliability, administrative features to woo wary IS

By Elisabeth Horwitt

IBM, Novell, Inc. and Microsoft Corp. are all expected this fall to launch peer network operating system products aimed at the corporate market. Their intent is to beef up what have traditionally been low-end, small company local-area network systems with enough reliability, power and administrative features to attract wary corporate information systems managers.

It could be a hard sell. "Most corporations are scared to death of peer-to-peer systems," said Jamie Lewis, president of the Burton Group, a consulting firm in Salt Lake City. "It's anarchic, with every user his own network administrator."

Peer network operating systems such as Arlinssoft, Inc.'s LANtastic, Novell's NetWare Lite and Microsoft's Windows for Workgroups enable desktop systems on a LAN to share files, printers and applications directly, without the formality of going through a server.

Positives and negatives

Such systems are said to be less expensive and easier to implement. However, the absence of a server also makes it harder to ensure consistency across duplicate sets and to administer user access rights, vendors and analysts agreed.

A recent IBM market survey found that "the value of a peer-level connection is high at two users and almost goes at seven to eight users," said Art Oberle, IBM's Personal Systems director. After that, he said, IBM customers re-

ported "they had to introduce a server, for [else] keeping track of access rights, passwords and files gets out of hand."

Announcements this fall will attempt to win corporate hearts by providing a hybrid system that can connect with equal ease to other peer systems and to a popular server such as Novell's NetWare (see story below).

Hybrid products also provide workgroups with an easy migration path from peer to client/

peer software as an add-on system that makes it much easier to network the average desktop workstation, Lewis said. Windows for Workgroups, for example, is "network-ready, with electronic mail and scheduling included," just like a Macintosh, he said. "It took me five minutes to install the Mac OS/NetWare and all day to install Windows."

Big hurdle

However, vendors will first have to combat some well-entrenched preconceptions of peer networking as a product for tiny companies.

"I'm not taking NetWare Lite seriously; it's redundant when you have full NetWare," said Glenn Fund, president of the Boston Area Novell User Group who is in charge of networks for a large New England defense contractor. NetWare v3.11 is no more complex to set up than NetWare Lite, Fund said. "The complexity comes from having to assign lots of rights to lots of users."

Even value-added resellers (VARs) seem to steer clear of recommending peer systems.

Kim Kegge, a network administrator at Bay States Gas Co., suggested to a VAR that NetWare Lite would work well for the New England Gas Association, "which has a small office." The consultant countered by recommending a 10-user version of "full-blown NetWare."

In addition, when Microsoft ships its Mail Application Programming Interface (MAPI), Windows for Workgroups will potentially tie any application to any E-mail system supported by MAPI, Lewis said.

Source: Computer Intelligence/Infoworld, Santa Clara, Calif.

server environments as their numbers grow, according to vendors.

There could be a corporate niche for such hybrids, analysts said. "I think the old NetWare 2.3 market of 45 to 60 users is where the more robust peer network products will fight it out," said Stan Schatt, director of LAN services at Computer Intelligence/Infoworld in Santa Clara, Calif.

One potential corporate niche

is for peer software as an add-on

IF YOU'RE RUNNING CICS ON A MAINFRAME, YOU'RE MISSING OUT ON AN 80% SAVINGS.

The Encore Infinity 90™ easily runs all your existing CICS COBOL VSAM programs with operational savings up to 80% over your current mainframe installation.

And it does it on your existing 3270 network with a consistent and unchanged interface for your users. It is transparent to your COBOL application programmers and offers massive scalability and I/O throughput to consolidate the workload of several mainframes on a single, open system. Migration of your CICS applications to an Infinity 90 with Integris' UniKix is painless, incremental and dramatically cost-effective. And you won't have to worry about re-engineering costs, re-training costs or interoperability with your CICS applications. Integral to Infinity 90 is a full range of system management software, including tuning, administration, monitoring and security all built with user-friendly, contemporary graphical interfaces. Call us and we'll quantify these savings and performance increases. Scale the future with ease. Call Encore today.

Beaverton, Oregon, Boasts Two World Leaders.

Welcome to Beaverton.

Where you'll find the headquarters of the world leader in athletic footwear. As well as the headquarters of another, slightly less well known world leader: Sequent® Computer Systems.

Sequent leads the computer industry in mid-to-high end open computing systems. A fact recently confirmed by both IDC and Infocorp.

Sequent's credentials include thousands of systems installed worldwide. The first commercial symmetrical multiprocessing servers. And new servers specifically designed for Microsoft's Windows NT™ operating system.

In short, we know our technology.

But just as important, we know the real world. We know our customers use our systems for mission-critical business applications. And we know, from experience, that complicated, open, multivendor installations are the norm - with complex interdependencies between hardware and software.

That's why everyone at Sequent is 100% committed to the complete success of every installation, and empowered to deliver it. Not just for our own hardware, but for everything in the system, hardware and software, no matter who the vendor may be.

It's not a promise made lightly. But it sure is one that befits a world leader.

Our Business Is Your Success

Unisys restructures as president exits

By Thomas Hoffman
BLUESBELL, PA

Unisys Corp. last week consolidated five units into three, in an attempt to increase revenue as opposed to simply cutting costs.

At the same time, company President

and Chief Operating Officer Reito Braun departed.

With seven consecutive profitable quarters behind it, Unisys has entered what Chairman and Chief Executive Officer James A. Unruh defined as "Phase II" of its restructuring. The \$5.4 billion company's three major divisions now include

Information Services and Systems — which Unruh will oversee — Government Systems and Computer Systems.

By flattening its organization, Unisys eliminated the need for Braun, a 24-year company veteran.

Analysts and company insiders said they were not surprised by Braun's de-

parture because he had been pining to run his own outfit for years. "Plus, it reflects how companies are restructuring these days, from the top down instead of from the bottom up," said Barry F. Bosak, a financial analyst at Smith Barney Shearson, Inc. in New York.

Braun promptly landed a top spot as chief executive and president at Moore Corp., a \$2.4 billion business forms producer in Toronto.

Most analysts, including Bosak, were unenthused by the restructuring, given the state of reorganizations sweeping the industry.

Deja vu

And Unisys has restructured before. But despite nearly two years of consistent profitability, the company's revenue growth has remained flat. To help pump life into its stagnant sales, the company last week also created two integrated business units that will focus on information services and client/server systems.

Unruh said the changes at Unisys should be viewed as attempts by the firm to enhance "profitable" revenue growth. Many analysts had blamed Unruh's predecessor, W. Michael Blumenthal, for seeking revenue growth at the expense of long-term stability, which nearly drove the firm to bankruptcy by 1990.

Unruh is continuing to reposition Unisys as less of an equipment company and more of a services and technology solutions provider for the four primary markets the company serves: financial services, airlines, telecommunications and the public sector.

Most users said they would give the new organization time to settle in before evaluating its performance. Still, several Unisys customers said they hoped the restructuring would result in improved support and training.

"We have some ups and downs with customer service," noted Rick Zizak, an information systems manager at The Miller-Paper Co. in Cleveland. Millercraft, which purchased a Unisys Unix/6000/75 Unix machine last year, has since experienced trouble getting answers to technical questions from Unisys representatives. Zizak said he believes strong demand for the Unix machines has stretched the vendor's slender support staff even thinner.

"I had found that I did not get the Unix support that I got from the A series [mainframe] support team. They need to get more people over on that side of the fence," Zizak said.

Maintaining proper staffing levels among business units will be just one of the new challenges facing Al Robbins, whom Unruh last week named as vice president of organizational change and development. Robbins, who hails from the company's human resources department with a Ph.D. in organization development from Stanford University, will also be charged with addressing corporate training and enacting cultural change during the transformation.

Cincom's AD/Advantage Application Generation System

AD/Advantage generates client/server applications thousands of times faster than programmers can write them. And with our new AD/Advantage for Windows, you'll push the boundaries of speed and productivity. Fully-portable applications can be developed and/or deployed on IBM MVS, VSE (ICRS and IMS/DC) and VM; most UNIX systems; Digital OpenVMS and OS/1; DOS and OS/2. And AD/Advantage supports strategic data bases including SUPRA, DB2, SQL/DS, DL/I, Rdb, Oracle and others.

Viacom CIO climbs corporate ladder

By Allan E. Alter
NEW YORK

Viacom International Inc., the \$1.9 billion media company that owns the MTV, Nickelodeon and Showtime networks, last week elevated its CIO to the upper echelon of the corporation.

Henry J. Leingang, who has held the

title of chief information officer since joining Viacom in 1990, has been promoted from vice president to senior vice president. He continues to report to Frank J. Biondi Jr., Viacom's president and chief executive officer.

"The promotion elevates me to peer level with other functional executives in the company," such as the chief financial

officer or the head of the legal department, Leingang said.

Leingang's ascension reflects the changing nature of the mass-media business. Having an astute technologist involved in business strategies is critical, given how quickly the entertainment, computer and communications industries are converging. The promise of mul-

timedia and interactive TV presents new business opportunities, which could go unexploited without a clear understanding of information technology.

No longer back-office

The promotion also reflects the elevation of the information systems organization at Viacom from a back-office function to "an enabler of operating strategies," Leingang said. "The information systems and technical function is becoming more important to the company. With the trends going on in our industry — regulation, [corporate] alliances,

YOU'RE LOOKING AT THE ANSWER TO YOUR COMPANY'S NETWORK OUTSOURCING NEEDS.

Actually, you won't find the answer on this piece of paper. At least not yet. And that's exactly the point.TM

Your business is different from everyone else. Your networking needs are unique. So why is it so many companies already have a pre-packaged, one-size solution to your networking problems, even before they've asked you a question?

At AdvantisTM we believe the only real answer is to start with a blank sheet of paper. We'll sit down with you and discuss your specific requirements. Then we'll recommend a solution that's designed for your company.

No one is more capable of handling your networking needs, because networking is our only business. Our

Custom Network Solutions provide the foundation for all, or part, of your data, voice and video network requirements from re-engineering through implementation and management. We also offer many other value-added outsourcing opportunities including a full range of remote computing and messaging services.

So if you're tired of pat answers or blank stares, let us start with a blank sheet of paper. Call the networking experts at Advantis: 1-800-775-5808 or send an electronic message to USAVTAADV at BMMAILTM today.

competition and technology — we need good information systems and a good technology infrastructure so we can respond quickly to changes in the marketplace," Leingang said.

After joining Viacom in 1990 as its first CIO, Leingang led a major overhaul of Viacom's information technology infrastructure while simultaneously decentralizing and expanding the IS function. The company has moved from a centralized IBM mainframe environment, running MVS on an IBM 3084, to one that uses 10 IBM Application System/400s as servers for more than 2,000 PCs.

Four of Viacom's major business units, as well as its New York headquarters, are each served by their own IS organization; the vice presidents of these IS organizations report to both Leingang and the CEO of their business unit.

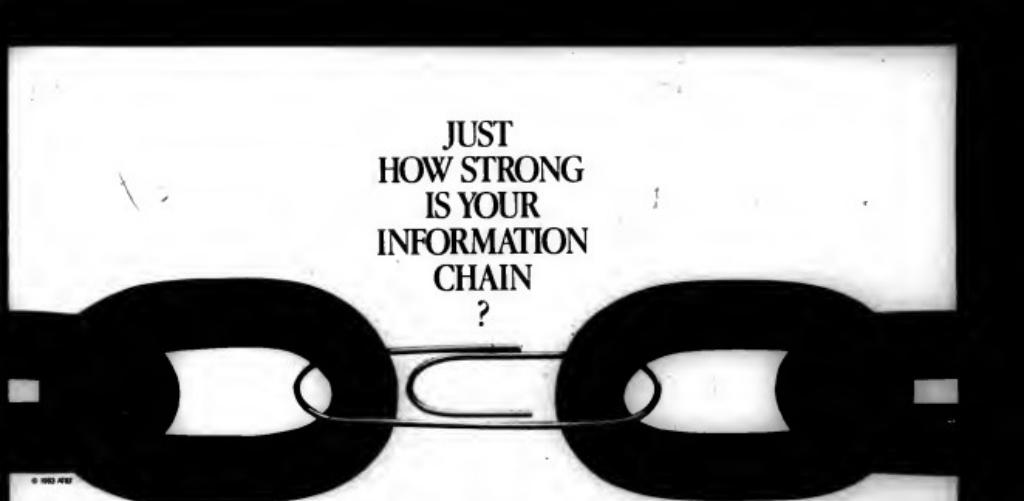

With the restructuring effort behind him and a wide-area network in place, Leingang is focusing on improving service to the cable operators and advertisers that make up much of Viacom's customer base and enabling and promoting cooperation between Viacom's business units.

"As the [information technology] infrastructure grows, it supports the way things flow between groups, as opposed to supporting specific funds within the company," Leingang said.

He declined to discuss specific applications but said he expects to see the creation of tools that would help advertisers select advertising spots and coordinate advertising across Viacom cable TV networks.

In the more distant future, the network may be the means by which work flows between producers of TV programs and the distributors who deliver such programs to viewers. For example, *Roseanne* could be transmitted over the network, or a producer could send a video clip to a network executive as an attachment to an electronic-mail message, Leingang said.

JUST HOW STRONG IS YOUR INFORMATION CHAIN ?

The weak link could be your data transmission. That's why so many businesses rely on AT&T ACCUNET® digital services.

You've got the best computers. The most sophisticated software. And backups upon backups. But if your data lines don't have the *same* level of reliability, your information can end up missing in action.

AT&T ACCUNET services have the reliability you expect from AT&T. Because only AT&T has FASTAR™, an exclusive "self-healing" technology that immediately identifies cable cuts and automatically reroutes data around trouble spots. Restoring service in minutes, instead of hours.

But FASTAR is only *part* of the AT&T reliability story—there are many other chapters. The bottom line: no matter what your reliability needs, our experienced sales force can help determine the required reliability levels for *your* applications.

You don't have time for downtime. You need AT&T ACCUNET private line digital services, designed with the latest technology to help give you maximum network "uptime." For more information about both domestic and international connections, call your AT&T Account Executive or 1 800 248-3632.

AT&T. The Best in the Business.™

How do you get everyone working in concert?

To stay competitive, you're constantly searching for better ways to orchestrate the flow of information. How do you get more out of your PCs? How can you make the most of your existing systems? What can be done to streamline your organization? More often than not, the answer is IBM Client/Server.

IBM can develop open client/server solutions that put the combined strength of all

your computer systems to work for you. We have thousands of specialists worldwide who can work with you to custom-tailor a solution that's right for your particular business. And we'll work with you at any stage of the process, from initial consulting to helping you tie everything together—we'll even manage your systems for you.

Whether you're upsizing or downsizing, nobody knows how to ensure systems reliability and security for your "mission critical" applications better than IBM.

We can also help you integrate different types of hardware, software and networks. We have the industry's widest array of software and network products, and we support Distributed Computing Environment (DCE), enabling different computer brands and platforms to work together in harmony.

For more and more companies, IBM Client/Server is the key to getting everyone working in concert. We've done it for hundreds of companies. We can do it for you. For more information, call 1-800 IBM-0045, ext. 10.

There's never been a better time to do business with 

Bombs go away

By Ellis Booker

Last month was the 45th anniversary of Trinity, the first nuclear bomb test, conducted on July 16, 1945.

But a great deal has changed since that day just before dawn in the desert in Alamogordo, N.M.

For one thing, the end of the Cold War and a recent U.S. commitment to suspend underground nuclear tests (at least through September 1994) has prompted the makers of mass destruction weapons to turn to alternative ways of testing.

Enter a variety of planned projects to simulate nuclear blast tests. (The U.S. conducted its last underground nuclear test in September 1992.)

However, bomb designers are not at all that confident that computer models alone are sufficient.

"By and large my feeling is these computer simulations are vastly overrated," said Steve White, a technical specialist at Los Alamos National Laboratory in New Mexico.

White, who has 10 years of experience in weapons research, said the trouble lies in nuclear physics and the equations used to understand it.

"As far as our fundamental understanding of the physics, we're at mesh resolutions that are two to three orders of magnitude too large," he said. In other words, calculations of these complicated equations are still not detailed enough to predict outcomes.

White said even when aided by the most sophisticated computers — Los Alamos uses both Cray Research, Inc. supercomputers and Thinking Machines Corp. massively parallel processor systems — scientists still must "evolve" the computer code to make the results match the observed reality.

Nevertheless, bomb-simulation efforts are going forward. Along with computer models, planned Pentagon projects call for the construction of specialized centers for simulating aspects of bomb blasts such as X-ray radiation and heat using non-nuclear materials.

Proposers of simulations said these systems will accurately gauge the bombs' explosive potential and their impact on different targets and answer questions about the shelf life of warheads.⁴

Program applies humanlike reasoning power to draw analogies

"A native talent for perceiving analogies is...the leading fact in genius of every order."

— Psychologist William James, 1890

By Mitch Beets

When we read about a new episode of official misdeeds, shredding documents and lying to Congress, we immediately call that a "cover-up" or "another Watergate." We may even give it a name ending in gate, such as Contragate. This subconscious ability to draw an analogy — a resemblance between something we know and something new — has intrigued researchers who want to give computers human-like intelligence.

In a new book, *Analogy-Making as Perception* from MIT Press, researcher Melanie Mitchell describes a computer model called Copycat that attempts to mimic humans' analogy-making ability, albeit in the limited domain of the English alphabet.

Copycat is an intelligent program that constructs analogies by matching patterns it sees in a string of letters (see box).

And how does Copycat compare with human efforts to solve letter-string analogy problems? The computer program matches two-thirds of the answers that are commonly given by three or more people, according to Mitchell, who is an associate professor at the University of Michigan.

Tech Talk

Auto safety

A Swedish professor whose daughter was killed by a drunk driver has developed an electronic car-car computer system that would allow only authorized persons to operate cars.

Unveiled earlier this month, the proposed system would ban drunk drivers from the road by invalidating their electronic cards. The system could also reduce car theft, said Swedish officials who funded the work.

On another front, two months

PROBLEM 1
 $\text{abc} \rightarrow \text{def}$
 $\text{ghi} \rightarrow \text{jkl}$
 $\text{mno} \rightarrow ?$

PROBLEM 2
 $\text{abc} \rightarrow \text{def}$
 $\text{ghi} \rightarrow \text{jkl}$
 $\text{mno} \rightarrow ?$

PROBLEM 3
 $\text{abc} \rightarrow \text{def}$
 $\text{ghi} \rightarrow \text{jkl}$
 $\text{mno} \rightarrow ?$

Most humans answer **xyz**, which assumes the alphabet is circular. Copycat is not programmed with that assumption, so it fails to arrive at that answer. Another creative answer is **lmnopqrstuvwxyz**, a mirror image of abc and then replaces the leftmost letter with its predecessor.

The program's biggest shortcoming is that when it hits a brick wall, it keeps banging its head. For example, when it tries to find the successor to **z** in Problem No. 3 above, it goes into a state of "mindless, loopish behavior" because its program does not allow for a successor to **z**, she said.

Copycat tries again and again (nine times in a row) to find the successor to **z**, whereas a human would give up after two or three failures, Mitchell wrote.

Not quite human

The fundamental problem is that Copycat lacks the human trait of "self-awareness," or monitoring its own processes, according to Douglas R. Hofstadter, the intellectual godfather of Copycat and director of the Center for Research on Concepts and Cognition at Indiana University.

"Humans do not get caught in obvious loops; they quickly perceive the pointlessness of loopy behavior and jump out of the system," he

ago. Toyota Motor Corp. announced a prototype "advanced safety vehicle" featuring computer-based systems for preventing collisions.

The safety devices, which the Japanese carmaker said might be built into future commercial car models, include a system that automatically dims or reorients headlights to avoid blinding oncoming traffic; a wristband that monitors a driver's heart rate and stops the car if he does off; an alarm that sounds when the car comes too close to a vehicle ahead (and will even put on the brakes if the driver fails to take action); and a flight recorder-type system for recording events just before a crash.

wrote in the book's afterward.

Giving a computer such self-awareness would bring it closer to having humanlike consciousness and true human creativity, Hofstadter said, because creativity requires the ability to "fail without falling into mindless ruts."

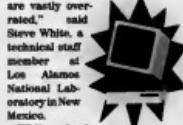

Hofstadter said he hopes Copycat can evolve into a more creative program, dubbed Metacat, that would have a better sense of what it is doing, perhaps even "engage in banter of sorts with a human about the merits and demerits of a given solution."

Ideally, he said, Metacat would also be able to store its past experiences in episodic memory to help it tackle new problems, see analogies between analogies and move beyond solving puzzles to making up new ones.

Hofstadter said research at Indiana University is moving toward that long-term goal, but he acknowledged that "these wildly ambitious ideas are unlikely to ever be realized in full."

Car content rules

Meanwhile, U.S. automakers race to develop tools to help their 10,000 suppliers comply with vehicle content reporting rules to be imposed under the North American Free Trade Agreement. Earlier this month, a task force from Chrysler Corp., Ford Motor Co. and General Motors Corp. was established under the auspices of the Automotive Industry Action Group (AIAG). The group was charged with developing a common content reporting format; the AIAG has also developed an electronic data interchange transaction set for content information.

White, who has 10 years of experience in weapons research, said the trouble lies in nuclear physics and the equations used to understand it.

"As far as our fundamental understanding of the physics, we're at mesh resolutions that are two to three orders of magnitude too large," he said. In other words, calculations of these complicated equations are still not detailed enough to predict outcomes.

White said even when aided by the most sophisticated computers — Los Alamos uses both Cray Research, Inc. supercomputers and Thinking Machines Corp. massively parallel processor systems — scientists still must "evolve" the computer code to make the results match the observed reality.

Nevertheless, bomb-simulation efforts are going forward. Along with computer models, planned Pentagon projects call for the construction of specialized centers for simulating aspects of bomb blasts such as X-ray radiation and heat using non-nuclear materials.

Proposers of simulations said these systems will accurately gauge the bombs' explosive potential and their impact on different targets and answer questions about the shelf life of warheads.⁴

High performance.

The drive to succeed.

What drives your business forward? Meeting your marketing objectives? Increasing your competitive edge? Delivering innovative products? It's probably all of these and more. And that's where SAP software can help.

We build software that can power your drive for success. In fact, SAP software is already doing that in nine of the top ten *Fortune* 500 companies. That's because the R/2 and R/3 Systems are ready-to-run, integrated solutions for today's business-critical problems. And, they deliver high-level performance in both mainframe and open, client/server environments. Add in support for multinational currency, language and legal requirements, and it's easier than ever for offices from Paris, France to Paris, Texas to work together.

So why not make the most of your drive to succeed? Call 1-800-USA-1SAP. You'll find out how we can help keep your business on track—no matter what's around the bend.

The New IEF for As Revolutionary for As Notes Were for

Client/Server. Information Systems Music.

The advent of sheet music created a revolution. One that allowed different musicians using different instruments for different melodies to communicate together. One that provided common access to structured, rule-based information. One that transcended barriers of time and language, opening up a whole new world of creativity and productivity.

In other words, a revolution exactly like the new IEF for Client/Server from Texas Instruments.

Built on a 5-year track record, market leadership for rapid application development tools and a customer base that includes 50% of the Fortune 100, the IEF for Client/Server can integrate the desktop, midrange and mainframe for unparalleled performance.

The entire application, including client, server and all communication components, are developed and maintained as a whole from within a single IEF model. What's more, components can be reused in new client/server applications and deployed across different environments.

The IEF for Client/Server allows in a single specification the flexibility to generate

complete applications for a variety of execution and database platforms. Which means you can go horizontally, vertically or cross-enterprise on systems such as Microsoft,[®] HP,[®] IBM,[®] Sun,[®] NCR,[®] Sequent,[™] Tandem,[®] Digital,[®] Oracle[®] and Sybase.[®] All without missing a beat.

The IEF for Client/Server allows IS managers and end users to work at a higher level of abstraction within the IEF information model. Alleviating the need to add languages, DBMS calls, and communication protocols. Like sheet music, the IEF gives end users and IS professionals the ability to communicate in universal language.

The IEF for Client/Server enables your business to rapidly respond to change which, in turn, increases your competitive position in the marketplace. And that's not all. TI offers products and services that effectively reengineer business processes and transition legacy systems to client/server technology.

All to extend your company's reach. And to keep your information systems working in harmony.

For more detailed information, call 1-800-338-5236, extension 1423 today.

Crosses platforms.

Crosses communication barriers.

Enables change.

Based on IEF
the number one
integrated
CASE tool
in the industry.

Model-driven
flexibility

Vows and wows

During a chat last week with an industry CEO, the conversation turned to the issue of promises made, promises broken. It's a conversation I've had with a number of executives in recent months, and the talks have had a surprising similarity.

Usually I'll point out that companies get upset when reporters drag out old press releases detailing some profound product strategy the vendors had unleashed. Reporters, being reporters, then note discrepancies between all the promises made and what actually transpired a year or two later. You hear it all.

"Things changed. All that client/server stuff popped up. The economy went South. Buyers became smarter. Buyers got dumber. There was a major market shift. We postponed a change in our strategy. We got a new CEO."

Vendors will then often point out that flexibility is a hallmark of a nimble, adaptive company. Or that one can foresee the impact that a change in one sector of the industry will have downstream on another seemingly unrelated sector. For example, as one software executive noted, the rapid decline in PC hardware prices spurred laptop sales, which in turn gave renewed life to stand-alone productivity software packages and (get this) might also slow the planned introduction of improved network versions of the same packages.

OK, so we accept that things change and most major market-shaping trends are never adequately foreseen. Still, corporate users continue to be pulled along one path or another by various statements of direction, usually in the name of giving the customer a clearer vision of what's to come.

Not to pick on anyone, but go through your files and see what IBM was going to bring forth with SAA, namely one big coherent distributed processing system. It will bug IBM to see me dredging up this now spot.

The fact of the matter is, however, that when SAA was announced in 1987, IBM was absolutely dominant. So if managers bought into the SAA concept lock, stock and barrel, the fate do proprietary nature of SAA that lurked beneath the covers would have a vice-like grip on many users several years later, as more open computing environments emerged.

In time, the marketplace sorted out the winners and losers, with the proprietary-based companies following a road to ruin. But the way was also littered with customers who bought the vision.

A flip response would be "buyer beware." If you're so naive to buy into any vendor's long-term vision at a time when no one can clearly foresee the industry landscape more than a year out, then you'll get the trouble you deserve.

An appropriate response is to ask for more socially responsible, politically correct behavior from leading vendors. Meanwhile, we'll continue to carefully monitor the promises made and weigh them carefully against the promises kept and the promises broken.

Beig Laberis

Bill Laberis, Editor in chief

Structure sought

After reading Joanne Kelieber's editorial "Quick isn't dirty" (CW, July 19), I felt a little amused. Sure, few would take such naivete seriously. But then I began to think — some people really do believe you can engineer an application without any structure. Engineer a process without any structure?

The real problem with her article is the underlying management philosophy I refer to as "short-termism." The key words of this philosophy are "fast and cheap." Corporations that let these two words drive their information management direction will quickly lose the competitive battle.

In today's competitive environment, risk management is critical. There are many ways to fail and few to succeed as any entrepreneur knows. Of course, I tend to define success by how long you stay in business and how well you maintain or gain market share through product innovations, and not by how much money you made last quarter. Quick isn't necessarily dirty, but without a structure it will quickly become that way.

*Jeanne Kelieber
Kansas City, Mo.*

Perhaps the term "structured methods" is a bit too rigid to use in the context of today's PC-to-mainframe range of software development. Joanne Kelieber's observation that development is devoid of or lacks anything that smacks of a structured framework is disturbing.

Her example of the "big box" who trades the whole idea is no executive I'd like to have in my organization. Likewise, "by-the-

book sorts" are as antiquated in modern IS departments as they are in the business world today.

The only real differences we are discussing are the development platform, the degree of user sophistication and whether the software needs professional IS attention. I defy any CEO, COO or CIO to achieve anything remotely resembling successful use of computer automation in either the near or longer term if they persist in churning out glossy, colorful, piecemeal, tick-off, hit-and-miss "applications."

*H. James Brown
Frankenmuth, Mich.*

Joanne Kelieber reports the demise of structured methods. She should know they have evolved into object-oriented design, and as such are proving very successful wherever people are solving difficult problems such as real-time simulations and control, especially where safety and reliability are paramount.

Even electronic bookkeeping systems benefit from an appropriate level of design, and these methods work for those who know how to use them. IS has rarely shown much interest or competence in design, resulting in generally poor quality and long development cycles of existing systems. It is fallacious to blame this situation on methods not used.

*Andrew Raybould
Jersey City, N.J.*

Court decide

I was surprised at Paul Gillin's argument in his editorial "ITexxas" (CW, July 26) that the current fierce competition for the desktop

is proof that the Federal Trade Commission investigation of Microsoft "is a waste of time." His position reads more like a statement from Microsoft than an editorial in an independent industry journal.

We are led to believe the presence of powerful alternatives to Windows (e.g., IBM's OS/2) and Microsoft applications (e.g., Lotus' SmartSuite) is evidence that Microsoft does not "monopolize" the industry.

But, perhaps, the ferocious of Microsoft's competitors in the face of (allegedly) unfair practices is more a statement of their competitive persistence rather than a statement of Microsoft's innocence. No one denies that competition exists, but the fundamental question remains unanswered: Does Microsoft engage in anticompetitive practices and, if so, what would be the competitive effect of legally ending those practices?

The "final word" on the Microsoft case should be heard from the courtroom, not from the editorial pages of Computerworld.

*Paul J. Rostick
Wayne, Pa.*

Re-engineering: An emetic in a perfume bottle?

Paul A. Strassmann

There's nothing new or original about business process re-engineering. It's just a lot of old industrial methods, recycled and repackaged to seem like the latest in management science. The only thing new about it, aside from its fancy trappings, is the situation that occasioned its revival.

Early in 1990 an economic event took place in the U.S. For the first time ever, white-collar unemployment exceeded blue-collar unemployment, giving rise to the entrenched belief that a college education entitles you to a job with superior earning potential, long-term job security and the opportunity to climb a career ladder. Large white-collar unemployment should not come as a surprise. The information work force has increased steadily since 1979 and now stands at 54% of total employment. This amounts to 40 million more information workers since 1980.

What do these people do? Mostly, they perform functions that would be categorized as corporate or social overhead — as lawyers, consultants, managers, executives and experts of all sorts. And nowhere are they more heavily settled than in government, which now employs more people than manufacturing.

Who pays for this overhead? Everybody does. Some of what we pay is extracted from increased taxes. Most of it used to be paid from increased prices. As long as U.S. firms could raise prices, there was always room for more overhead. That ceased to be true about a de-

By Paul A. Strassmann

cade ago.

Blue-collar labor went first, as jobs were either outsourced to foreign lands or rationalized, using proven industrial engineering methods. But by the mid-1980s, major cost cuts could only come from overhead reductions.

Early attempts to reduce white-collar labor were botched. Layoffs, preceded by announcements of 20% plus across-the-board job cuts, misfired. The most valuable experts left first. The next wave was even more wasteful. Cutting overhead by imposing arbitrary targets magnified disorientation and demoralization.

Companies responded to these crude methods because they had no interest in assessing the value-added of information workers. They

knew how to do this for blue-collar employees, but found this did not tolerate subjecting management processes to this kind of scrutiny. This is where business process re-engineering came in. It rebooted well-known industrial engineering methods of process analysis, activity costing and value-added measurement.

Re-engineering excels more in its packaging than its substance. Its purpose is to make the purging of past staffing glutony more palatable to managers. It is important that this process be palatable because, if you recall, budget cutters really can't know the consequences of their actions when it comes to management jobs. Unless they want to eat blindly, they need the tolerance and assistance of those who know something about how things work.

The cure is now administered in large doses to businesses that must keep up profits to survive. Despite ornate pronouncements about re-engineering from government leadership, it remains to be seen if the government will be willing to take the medicine. An emetic will always be an emetic, regardless of the bottle it comes in. And it only works for those who take it with the resolve to eat only what they can afford to chew.

Strassmann has served as a corporate information executive for General Foods, Kraft, Xerox Corp. and the U.S. Department of Defense.

What is your company's operating system?

OPEN MIND by Esther Dyson

I'm not talking about your computer systems, but your company itself. Is it single-tasking or multitasking? Modular or monolithic?

Rob Wilcox, chairman of re-engineering company Oasis (and the man who turned around the UK's ICL), considers his firm's task to be designing new operating systems for clients' companies, not their computers.

You can argue with this point of view, but if offers a useful framework: It makes sense to assess a company's operations before you think about what computer systems it might need.

That's the idea behind back-to-basics, zero-budgeting re-engineering. And it makes sense strategically, too. A company needs to run on a smooth platform before it can worry about the details of its products, services or strategies.

Much as the operating system world developed on PCs (and, in ancient times, on miniframes), most companies, with a single focus, have a single operating system, a single hierarchy of management, one product line and one set of customers. The entire resources of the company are focused on the single task of serving those customers. You can't really do two things at once, but you don't need to.

Then the company decides to go into a second business, and it usually develops a parallel, separate structure for that second business. That's like building a second operating system to run a second set of applications.

There's not a lot of connection between the two operations. Functions may be duplicated. But it seems easier than trying to coordinate the sharing of functions, especially because each group has its own way of doing things that's particularly suited to its target market and style of operations. (Do I hear "incompatible protocols" in the background?)

Growth apart

But then the company grows some more. Now it has 10 different units, each with its own way of doing things. It adds new functions that it used to buy from the outside. Of course, each unit is a special case with its own market and style, and it certainly couldn't share, say, a marketing campaign or a personnel policy with another group. (Doesn't that sound just like some proprietary operating systems that have their own complete file structures, graphics standards, protocols for storing information and communications protocols?)

Suddenly sales slow and management starts looking at costs. "We're using 10 times more

resources than we need!" say the accountants. ("Resource constraints.") The overload of coordination among different units is a killer ("Middleware.")

Management would like to contract some of the work out, reduce overhead and have single cross-unit services for common functions such as purchasing, hiring, marketing and involving.

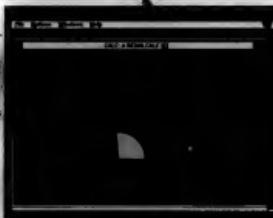

It will take a struggle, but that's what is needed. Services that were unit-specific (operating system-dependent) need to be separated out as services that can be used by any unit in the company.

The analogies aren't perfect, but they make the point. It is sensible to make common functions more generic (standardized) so they can be used by any function in any unit of the company. Understand your company's operating system and appropriate modules first. Then think about representing them in software and systems.

Dyson is editor of "Release 1.0" and "Rel-EAST," newsletters on new technology and new computer markets in Eastern Europe.

The Client/Server Solut

The SAS System for Information Delivery is a new concept in client/server software. It provides workable strategies for overcoming the barriers that stand between people and the information they need. For instance, the SAS System strategy for **universal data access** makes it easy to reach all your diverse "islands of information"—including host system files, flat files, and corporate DBMS's such as DB2[®], ORACLE[®], and dBASE[®].

An exclusive MultiVendor Architecture™ is behind the SAS System's strategy for **hardware independence**. Applications run the same way across PCs, workstations, and host systems—making true client/server computing a reality while exploiting the particular strengths of each platform.

Address the needs of users at every level with the SAS System's strategy for **interface versatility**. An EIS interface puts decision makers in command of the facts—when they need them. There's also a task-oriented menu-driven interface for business

The SAS Enterprise Wide In

ion for EIS and Beyond

analysts... plus object-oriented and full-function programming environments for applications developers.

The SAS System's **applications**

integration strategy provides one seamless solution for virtually any application that involves accessing, managing, analyzing, or presenting data. Choose integrated tools for decision support, reporting, financial analysis, market research, project management, quality improvement, and more. All backed by SAS Institute Inc., a vital force in the information

industry with a strong commitment to helping you succeed—and an unrivaled dedication to training, documentation, technical support, and consulting services.

See for yourself how the SAS System of software brings out the best in your hardware and the people who use it. Just give us a call at **919-677-8200** for a free video, plus details about a free software evaluation.

Attuned to ATM

With little preamble, a half-dozen key network suppliers advanced plans earlier this year for new lines of networking products based on Asynchronous Transfer Mode (ATM). For some, ATM has displaced 100M bit/sec. FDDI and CDDI as our salvation in a world gone mad for network bandwidth. Why the switch?

For one thing, ATM has those other options beat with speeds that go to 156M bit/sec. or higher. But IBM's first ATM product is likely to be a 25M bit/sec. ATM

adapter card for workstations, so speed is not the only factor at play.

ATM is also an example of a technology that can be used in both small and enterprise-wide systems. By taking the three primary forms of data—computer, voice and video—and converting each

into short, 53-byte cells, ATM is able to offer a simple connection-to-connection networking approach that does what ISDN was supposed to do, only faster.

ATM switch capacities can be increased as network loads increase, guaranteeing each user a set capacity rather than dividing up the same pipeline among more and more users.

Another factor in ATM's favor is that it's one of the few networking approaches that can link multiple LANs and transmit data to the WAN. Theoretically, ATM can potentially serve as both the WAN and the LAN.

Pacific Stock Exchange in San Francisco to connect to ATM next year for high-speed transaction and multimedia data feeds to brokers. ATM establishes a temporary end-to-end connection for each transmission, like a telephone call. A virtual circuit route is computed prior to transmission, which then allows the fixed-length packets to be transmitted, multiplexed and switched in silicon rather than through software. This is not only faster but more secure, which is a big concern for the stock exchange.

Older packet switching methods and LANs use variable-length packets that tend to be much longer than ATM's and subject to delays as each packet is routed through software. The delays make it difficult to transmit voice and video.

One of the pieces missing from a future dominated by ATM is ATM-carrying capacity in the public phone companies.

There is, however, a notable collaboration of three telephone companies under way in North Carolina, where the state government is establishing a regional ATM network to link research facilities, universities, schools and government offices for exchange of image and video files. They are cooperating to provide ATM-carrying capacity, an example that more phone companies may emulate.

ATM also lacks a multiple user access methodology, such as IBM's token passing or the collision storms detection on Ethernet. And the backbone net must possess capacity to satisfy all potential demand. If 25 users come on-line, each needing 100M bit/sec., the ATM switch will choke, even if it has a backbone capable of supporting 2.4G bit/sec.

The early users of ATM will be for intermediate backbone functions. Bob Metcalf, the inventor of Ethernet and publisher of the Metcalf Group in Cambridge, Ariz., predicts ATM will provide the bandwidth for future client/server applications. "When you try to blow hot databases out of a central computer, you need a bigger network" than existing LANs, he said.

These are only interim roles, however. As the use of client/server computing grows, greater throughput will be demanded of the network, and ATM will begin to fill more of the gap between desktop and global net.

Babcock is Computerworld's technical editor. His MCI Mail address is 570-5737.

Plan now!! Attend *THE* conference that addresses the critical issues affecting competitive companies and organizations throughout the world—

The Engineering and Management of Software

Washington State Convention and Trade Center
Seattle, Washington September 18-23, 1993

Industry keynote speakers

Gerald Ebker, Chairman/CEO, IBM Federal Systems Company
Way Ting, General Manager, Visual Magic Division, Silicon Graphics

Enhance your knowledge in these key areas:

- Software Process Improvement
- Object-oriented methods
- The legal aspects of software reuse
- Enterprise-wide software management
- Emerging technologies (i.e., Ada 9X)
- Safety-critical software systems
- Distributed heterogeneous software architectures
- Software engineering education & training
- Software metrics
- CASE
- Systems engineering

Network with other software professionals from around the world, and tour a major exposition containing some of the most advanced software engineering environments currently available in the international software market.

Ever since
Apple, IBM and
Motorola
formed their
alliance,
people have
expected
something big.

Well, it's not so big, but it's amazingly powerful.

Introducing the PowerPC™ family of microprocessors from Motorola.

How powerful is our first tangible result of the Apple, IBM, Motorola alliance? Unlike any other microprocessor, PowerPC Microprocessors have the power to change the course of computing.

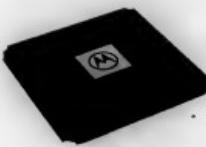

The PowerPC family of microprocessors will bring unprecedented high performance to everything from handheld computers to desktop computers to supercomputers. It will run circles around its only real competitor, the Intel®

Pentium™ microprocessor, and it will do so at a fraction of the cost. It will run today's standard computer operating systems, as well as those that are being developed for pen-based and object-oriented computing.

	Intel® Pentium®	PowerPC™
Frequency (MHz)	60	60
SPEC CPU92	66.5	>80
SPEC IP92	56.0	>80
Dynamic (bytes/clock)	32 ^a	16 ^b
Die Size (mm ²)	200	120

©1993 Motorola Inc. Motorola and the Motorola logo are registered trademarks of Motorola Inc. PowerPC™ and the PowerPC™ logo are trademarks of IBM Corporation. Processor is a trademark and Intel is a registered trademark of Intel Corporation. All rights reserved. Speed comparisons are based upon SPEC92 results of performance of the 60MHz version of the Processor as compared to the Intel® and Motorola's announced simulation performance of the 60MHz version of the APIC92. Thermal comparison is based upon preliminary Intel specifications for the 60MHz Processor, and the performance of sample of the 60MHz version of the APIC92.

(actual size)

In fact, PowerPC Microprocessors will play a pivotal role in the imminent convergence of computing, communications and lifestyle products.

To take a closer look at the future of computing, call Motorola today at 1-800-845-MOTO. We'll be happy to provide you with more information, including our free PowerPC Information Pack.

And we'll show you the microprocessors that are changing the course of computing. The PowerPC Microprocessors from Motorola.

PowerPC Microprocessors. *Changing the course of computing. For the better.*

Hewlett-Packard has the most powerful vehicle for the top UNIX database applications to run on.

"If you're looking for the best strategic UNIX database platform, for now and the future, it's the HP 9000."

→ Aberdeen Group®

Hewlett-Packard is the #1 UNIX hardware vendor. So it's hardly surprising that we're also #1 with the top UNIX database vendors.

More Oracle and Informix software is sold on HP than on any other UNIX platform. And we're also the fastest growing UNIX platform for Ingres and Sybase.

Our robust, rich feature sets offer mainframe-style functionality. Another powerful reason why our customers confidently expect us to remain their #1 partner in Open Systems.

Call 1-800-637-7740, Ext. 7565 for more information.

Think again.

Software integration: Vendor goal for the '90s

By Michael Vizard

If the major application software vendors can fulfill the technological vision they have laid out during the last several months, the day when applications cease to be distinct entities will not be far off.

Using a variety of enabling technologies, the major PC software vendors are racing to respond to user demands for greater levels of integration among PC applications.

"The vendors are lagging the end users in terms of demand for greater integration," said Krystyna Pilistowicz, an

"The word processor isn't a word processor anymore. It's a document you use to create proposals that include spreadsheets and presentation graphics," Pilistowicz said.

For most among the technologies intended to break down the barriers between applications is Microsoft Corp.'s Object Linking and Embedding (OLE) Version 2.0, which provides an object-oriented application programming interface designed to help one application take control and manipulate another application in a Windows environment.

For example, a user of a word processing package will soon be able to invoke a spreadsheet using OLE 2.0. Once invoked, the user interface will automatically switch over to the familiar command interface of the spreadsheet.

Probably the first major applications to take advantage of OLE 2.0 will be Version 6.0 of Microsoft's Word word processor and Version 5.0 of its Excel spreadsheet, both of which are due to arrive this fall. WordPerfect Corp., in Orem, Utah, and Lotus Development Corp., in Cambridge, Mass., are also expected to add support for OLE 2.0 within the next 12 months.

But OLE, along with predecessor technologies such as OLE 1.0, the Dynamic Data Exchange facility and Clipboard, are only enabling technologies that will

provide the way for a host of other enhancements that promise to make PC computing easier by creating a document metaphor, as opposed to the somewhat less than intuitive Windows environment that currently exists.

For example, Microsoft intends to use its Visual Basic programming language as a common programming language for its applications. By marrying Visual Basic with OLE 2.0, Microsoft will give users a tool for building macros that can then be applied across multiple applications using the OLE automation facility included in OLE 2.0. Similarly, Lotus has outlined a strategy that calls for a Lotus Script language, which is a derivative of Basic, to be embedded in its applications.

User knowledge

"Having more sophisticated macro languages will be important because the users have moved beyond what word processors and spreadsheets can do on their own," Pilistowicz said.

Right now, Pilistowicz said Lotus enjoys a small edge over Microsoft because it has thus far made greater use OLE 1.0 to integrate its SmartBuilder application package with Notes. But that is likely to disappear as Microsoft gears up to launch Version 4.0 of its Office suite this fall (CW, Aug. 6).

Meanwhile, the challenge for WordPerfect will be whether it can keep pace in an industry that is already dominated by software suites. "Over 70% of the applications people buy are purchased from

The upcoming Microsoft Word 6.0 should take advantage of OLE 2.0

one vendor," Pilistowicz noted. And as those suites become more integrated, WordPerfect will increasingly have to rely on alliances with other vendors to sell its word processing software.

For example, WordPerfect is working closely with Borland International, Inc. in Scotts Valley, Calif., to integrate its word processing software with the Borland Office suite of applications, which is built around the Quattro Pro for Windows spreadsheet and Paradox for Windows relational database.

In addition, WordPerfect plans to focus more of its efforts on making sure WordPerfect is tightly integrated across multiple platforms using the OpenDoc technology that is being jointly developed by WordPerfect, Novell, Inc., Apple Computer, Inc., IBM and Borland (CW, July 6). In contrast, both Microsoft and Lotus are putting most of their resources behind Windows and OLE 2.0.

Intelligence gains

Integrating applications using technologies such as OLE and OpenDoc may go a long way toward reducing the number of steps required to perform tasks, but the effort to make software easier to use by making it more intelligent is a separate initiative that will rely on agents that will be scripted to perform tasks.

For example, Microsoft will use Intelligent Sense agents in the next version of its applications to automate certain repetitive tasks. Using this type of technology as a base, vendors are researching more intelligent agent technology that will be able to monitor a user's actions, and based on that data, automate a specific task commonly performed by the user (CW, Aug. 9).

"Part of the problem is that creating a document-centric environment won't add any simplicity. It will be important to add customization that is task-oriented," said Dave LePere, a WordPerfect product manager.

Software integration, page 49

Support for the future

For information systems directors, the increasing complexity of PC applications means they will have to focus on building an infrastructure to run them, while also providing the necessary levels of user support.

"The idea behind this type of integration, but I can wait. We have to build the infrastructure first," said Meyer Peleg, president of International Business Applications, Inc., a systems integrator in New York.

In fact, the increasing complexity of supporting PC applications software has led Johnson & Higgins, a New York

insurance provider, to outsource PC software support to Corporate Software, Inc., a company in Cushing, Mass.

Tony Johnson, Higgins' senior software engineer in conjunction with Notes Vice President William Wilson, said his software becomes more complex and users discover the relatively quick response Corporate Software will provide, the real value of the contract will be equivalent to five to seven people working full time.

The good news for IS shops, however, is that while software may become more difficult to support in the future, the drive toward tightly integrated modular applications may make software easier to support.

"Rather than buying a single monolithic monolithic application, people will only buy smaller functions that they need to create their document," said Dave LaPere, a WordPerfect product manager.

And when that happens, users will be much more proficient, which in turn means they will require less support from IS, according to Krystyna Pilistowicz, an analyst at Datquest.

"The software is becoming much more idiot-proof," she said.

Heavy portables carry multimedia hopes

By Michael Fitzgerald

Amidst all the hype over personal digital assistants, some very heavy portables continue to draw interest in the market.

Toshiba America Information Systems, Inc. recently introduced T6600 multimedia portable weighs 18 pounds, but users are interested in it for its heavy-duty data capabilities. They are not pleased, however, that it has been delayed twice since it was announced. Toshiba said delays in getting master disks of software bundled with the box have slowed its ability to ship, and it now predicts a mid-September delivery.

"We have a very data-intensive business," said Michael Bennett, director of systems marketing at Nielsen Marketing Research in Port Washington, N.Y. "The products that we market to ad agencies use multiple CD-ROMs, and we have flowchart graphics that we really want to show in color."

Bennett said Nielsen's sales force currently travels to client sites with either a Compaq Computer Corp. 486C laptop or an IBM PC CS ThinkPad 700C. Neither will accommodate in-line packaging what Nielsen wants to do next—run segments of commercials during presentations.

"That's when I start to need different

sound and data compression boards available to the Toshiba," Bennett said. The T6600 has built-in speakers and two slots to support extra boards.

Love at first sight

CB Commercial, formerly Coldwell Banker, already uses multimedia portables to make presentations. The commercial real estate broker has more than 40 T6400s, the T6600's predecessor, spread across its offices. It started using the T6400 two years ago, after seeing Toshiba make a presentation using the box.

"We got involved in a couple of presentations from Toshiba and another vendor, and when we saw how they were doing it, we really got interested," said Abhishek Khodam, vice president of marketing and strategic planning at CB Commercial in El Segundo, Calif. He added that in CB Commercial's case, the company had little interest in multimedia beforehand. "It was a case of seeing it to live it," Khodam said.

Currently CB Commercial uses Troy, NY-based MapInfo Corp.'s MapInfo mapping software and spotlight latitudinal and longitudinal points from the U.S. Census Tracts to develop better ways to sell or lease commercial real es-

Toshiba's T6600C has caught users' attention.

tate. Using scanned-in photos and voiceovers, combined with an information management system on its various properties, salespeople have a handy and relatively lightweight way to tour around their presentations. CB Commercial also uses Lotus Development Corp.'s Freelance and Adius Corp.'s Pugelmaker soft-

ware for presentations. When CB Commercial gets a T6600 in hand, Khodam said he expects "we can absolutely make good use of it" to store megimedia-munching pictures on CD-ROM and run them more effectively. Khodam also said CB Commercial is testing full-motion video as a sales tool and can use the slot in the T6600 for this.

Flexibility key

Khodam says the T6600 will be more reliable than CB Commercial's fleet of T4600Cs for making presentations.

"Its flexibility is in letting you load so much. It isn't limited because of the power of the machine," he explained.

Bennett called the new multimedia box "an enabling technology" that will let Nielsen get data off of its desktop PCs and in front of clients. This is important because "a lot of clients want to see it before they'll buy anything."

Apps take stage at MacWorld

By James Daly
BOSTON

The four-day MacWorld Exposition earlier this month allowed hundreds of Macintosh software developers to trumpet their latest and greatest wares.

Apple Computer, Inc.'s newly introduced Newton MessagePad was a popular target for a good amount of this year's pre-rolling creativity, but developers also unveiled a wide variety of Macintosh-related products and initiatives that will arrive this fall. Among the announcements were the following:

► **Oracle Corp.** officials gave the MessagePad a nod of approval, saying they would link the Oracle 7 cooperative server database and Oracle messaging systems to the MessagePad via their Gue technology. Gue is an application programming interface capable of connecting diverse databases, mail systems and file systems on a variety of platforms.

The integration will enable customers to access Oracle databases wherever the user may be, according to Oracle officials. For example, an insurance company's field representative will be able to use the MessagePad and Gue to easily access a claims database at the corporate office.

No availability date was announced.

► **Sonic Software** Ex Machina, Inc. unveiled two applications that will allow the MessagePad to communicate with hundreds of on-line databases and receive wireless messages from desktop computers.

PocketCall, a terminal emulation program, allows a MessagePad user to respond to queries from host systems by simply handwriting text on the screen of the MessagePad or popping up an on-screen keyboard. The basic PocketCall application will ship in October for approximately \$100.

Ex Machina's Notify for PowerTalk is a messaging service access module that works to provide wireless messages to the MessagePad. Notify will also ship in October for about \$149, company officials said.

► **Motorola, Inc.** also jumped on the MessagePad bandwagon with the introduction of the Newtow Message Card, a lightweight credit-card-size receiver that allows MessagePad users to receive wireless messages, data and news services virtually anywhere they go.

When not inserted into the Newton, the MessageCard can be carried in a pocket or purse and can continue to receive and store messages wherever it is. Upon receiving a message, it notifies the user with a beep or a flashing light. The user can then insert the card into the Newton's Personal Computer Memory Card International Association Type II slot to download the message for viewing the information. The product is expected to ship in early September; no pricing was announced.

► **CE Software Holdings, Inc.** announced QuickAccess, which will allow Newton users to send and receive mail from a mailing list or a number of local-area network-based systems transports, including CE's own QuickMail, Novell's NetWare and Apple's Apple Open Collaboration Environment (AOCE).

Officials from the West Des Moines, Iowa-based company did not announce pricing or availability.

► On the non-MessagePad front, WordPerfect Corp. announced WordPerfect 3.0 for Macintosh, a new version of its popular word processing package that is in beta testing and expected to ship this fall. Version 3.0 includes support for Apple's latest technologies, including AOCE, AppleEvents, AppleScript, WorldScript and the QuickTime multimedia platform. Version 3.0 will retail for \$495, WordPerfect officials said.

Now the World's Leading Mainframe C Compiler Can Help You Make Some Powerful Connections

Introducing the SAS/C Connectivity Support Library—it's just what you would expect from the first name in C programming tools for the IBM mainframe environment.

Make the Right Connections

To meet the challenges of client/server applications development, you need powerful connections. That's why we developed the SAS/C Connectivity Support Library (CSL). This comprehensive set of library routines enables C programs developed with the SAS/C compiler on your SAS/C Business CMS mainframe systems to communicate with application programs using TCP/IP protocols on PCs, workstations, large servers, and even supercomputers.

Choose Just the Right Tools
With the SAS/C Connectivity Support Library, you can put today's most

advanced protocols to work in your own applications:

- X Window System version 11, release 3 (X11R3)
- Sun Remote Procedure Call (RPC), release 4.1
- Sun Network File System (NFS)
- X Window System version 11, release 3 (X11R3) implementations for the IBM mainframe environment. Plus, SAS/C/C++ works with a variety of TCP/IP products offering you complete vendor independence.

Find Out More In A Free Report

To learn more about client server development with the SAS/C Connectivity Support Library, simply call us today at 919-477-5200.

BUY THE WRONG RISK LOSING MORE

Join business and technology leaders from around the world at the Compaq Worldwide Technology Conference, INNOVATE '93, Houston, Texas, 9/13-9/17. Call 1-800-235-2133.

Using the latest processors, COMPAQ ProSignia and SYSTEMPRO/XL deliver industry-leading performance based on industry-standard benchmarks.

When it comes to finding the best server, you not only need great performance at a great price, you need the most reliable, easy-to-manage system you can find.

After all, a single server nightmare can turn what looked like a good investment into a costly mistake.

All of which explains why LAN Times readers chose our servers over all others for the third year in a row.

Because not merely are our servers leading the industry in price and performance, they're also the only servers with complete management capabilities built in.

Integrated fault prevention tools continually monitor server subsystems.

SERVER AND YOU THAN JUST YOUR DATA.

The COMPAQ INSIGHT Manager takes that information and alerts you to fluctuations, so you can avoid downtime. You can even program COMPAQ Servers to reboot automatically, or to contact you off-site so you can diagnose and reboot from your location.

So while others may suggest they offer close to COMPAQ performance based on their own fabricated benchmarks, you'll never hear them claim to have a more reliable, easier to manage system.

Because they don't. Not IBM. Not Dell. Not anybody.

And that's going to save you a lot more than an occasional headache. Call 1-800-638-8258 ext. 45 for details, and your free Novell Guide to NetWare 4.0.

COMPAQ

*COMPAQ Servers—*and only* COMPAQ Servers—alert you to hardware problems before they become problems, allowing you to troubleshoot and avoid network downtime.*

When you build more reliable products, you can offer a more extensive guarantee. Every COMPAQ Server includes our free 3-year, on-site warranty.

*This service provided by Contracted Service Providers and may not be available in certain geographic locations. Certain restrictions and exclusions apply. Monitors, battery profile and remote options are covered by a one year warranty. For further details on our limited warranty, contact the Compaq Customer Support Center. FROM WINDOWS TO HOST, IT'S THE MOST POWERFUL PATH TO A PRODUCTIVE PARTNERSHIP.

Multiple sessions, QuickPad, QuickScript™ and QuickHit productivity enhancers, and APA graphics are just a few of the strengths of IWW.

Relationships are changing. These days, the desktop and host can be powerful partners. But that requires far more from micro-to-host software than simple terminal emulation. It requires the power of IRMA™ WorkStation for Windows.

New IRMA WorkStation for Windows now includes support for NetWare for SAA™ and TN3270 over TCP/IP, as well as a variety of other

Unsurpassed connectivity options, including NetWare for SAA and TN3270 over TCP/IP.

The only Windows 3270 software with a QuickBar for instant access to functions like File Transfer and Print, as well as other common 3270 commands like Reset, Clear and Attention.

connections. And now IRMA/400 for Windows is available.

IWW is also easier than ever. With a unique new QuickBar toolbar; QuickHit™ to send commands by clicking on a host session PF key; and customizable QuickPads™ to automate common tasks.

In addition, IWW supports HLLAPI and APPC, and offers new cross-platform API Tool Kits like QuickApp™. QuickApp lets you build powerful applications without being an expert programmer. And it's the first example of DCA's Universal Communications Architecture (UCA), a framework that provides consistent access, features and APIs across host environments, network transports and operating systems.

If you haven't moved to Windows™, IRMA WorkStation for DOS offers many of the same powerful features, and a perfect upgrade path. There's also IRMA WorkStation for OS/2 and

Macintosh (with IWW NT on the way). From now through December 31, 1993, you can upgrade to new IWW from an earlier version, or from a competitive product, for only \$95. (That's \$330 off the suggested retail price. And the price can be even less, when you buy MultiPaks of 10, 50 or 100.) You can also get a free demo disk.

PDA revolution

It can be tempting for the IS manager to dismiss personal digital assistants (PDAs) — products such as the Apple Newton and Tandy Zoomer — as nothing more than toys. After all, the Zoomer even comes loaded with games and has built-in game keys. Meanwhile, the IS manager has more immediate technical issues to sort through, such as evaluating 32-bit operating systems.

Unfortunately for the busy IS manager, a number of factors place PDAs on the list of technologies under consideration. First, an IS manager's company may adopt PDAs with or without his blessing. Second, PDAs will satisfy some users'

needs better than portable PCs do. Third, PDAs will gradually change the way traditional PCs are used.

If only performance is considered, a PDA like the Tandy Zoomer, with its 8086-like CPU, is a toy compared with any notebook PC. Of course, strictly going by performance, the first IBM PC was a toy when compared with the most prevalent computer of the time, the mini. Data center managers who dismissed PDAs 10 years ago found themselves forced to confront PDAs once those devices came in the backdoor. PDAs not only will come in the backdoor, they will come in the back pocket.

Rather than be forced to develop a strategy for supporting PDAs after the fact, IS managers must make sure they have a hand in defining how their organizations integrate PDAs with existing information systems.

PDAs do offer genuine benefits. The principal benefit, despite press reports, is not mobility. No company or department is going to adopt PDAs for that purpose alone when screens, bound timers and address books provide comparable functionality for a few dollars.

More compelling than "keeping organized" for most users is "keeping in

touch," which is why AT&T refers to its PDA-like devices as personal communicators and why Apple named its first Newton the MessagePad. In the round-the-clock world market of the 1990s, time is money, and timely information is money. Voice communications are often not enough for remote workers; they need to send electronic mail, transfer files and transmit faxes.

While portable PCs provide this functionality, they are too hard to use for some workers, too bulky to be "unconsciously" portable and too expensive for widespread deployment. PDAs are therefore more suited for workers who have not yet used computers.

Interface interrupt

However, PDAs are going to change the face of computing. The interface, that is.

Apple's Newton Intelligence — the operating system of its just-released PDA — is as revolutionary as the GUI of the Apple Lisa. Newton Intelligence is the fullest incarnation of an interface called — get this! — the STIC! (pronounced "sticky"; what else would succeed the "gosey"?).

STIC stands for SelfTeaching and Interpretive Communicating Interface. Where the GUI was a more personable in-

terface than what went before, the STIC is a more personal interface. "Self-teaching" means the STIC customizes itself for each person that uses it; "interpretive" means the interface stores and recognizes personal information; "communicating" means the interface provides seamless management of person-to-person communications. All of these features make the STIC even easier to use and more productive than the GUI.

IS managers who dismiss the Macintosh as a cute toy forget that their lives behind the scenes. If it comes time to move their organizations to the Windows GUI, They lost the competitive advantage of being able to deploy custom GUI applications ahead of competitors.

Similarly, IS managers who dismiss the STIC will be behind the times when vendors such as Apple eventually incorporate STIC functionality into PC operating systems. The STIC will make it to the PC, even as the GUI eventually made it to the minicomputer.

In the long run, PDAs will become an important part of corporate computing. Any IS manager who treats PDAs as toys may be toying with his own future.

Heading is a senior industry analyst at BIS Strategic Decisions in Norwell, Mass.

Windows boost for optical character recognition

By Ellis Boeker
SUNNYVALE, CALIF.

Calera Recognition Systems, Inc., put its latest optical character recognition (OCR) engine on two Windows-based desktop products last week when it announced that WordScan 2.0 and WordScan Plus 2.0 will employ the next-generation technology.

In April, Calera unveiled Adaptive Recognition Technology (ART) for its high-end OCR systems. ART, a 32-bit software system, is said to use a more sophisticated and accurate neural networking technology than previous Calera engines, reducing recognition errors by 35%.

"Nobody's OCR has trouble with clean, laser-printed text," said Kristy Holch, director of scanning market strategies at BIS Strategic Decisions in Norwell, Mass.

Rather, all OCR vendors, she said, are grappling with how to do accurate recognition on hard-to-read documents, such as incoming faxes or 10th-generation photocopies."

Back in 1990, Calera was the first OCR vendor to offer Windows-based OCR packages. Desktop systems now account for a third of its

worldwide business, according to Calera executives, who said they anticipate increased activity in this category based on the mounting sales of fax modems, which have zoomed from 4,000 in 1990 to \$50,000 this year.

"We estimate 70% to 80% of the images people will need to [use OCR with] will be faxes," said Wes Rose, Calera vice president of sales and marketing.

Along with an improved Windows interface and a rudimentary forms recognition capability, the new desktop products to be the first OCR packages to support Microsoft Corp.'s Object Linking and Embedding (OLE) 2.0 standard. For instance, a user can drag the icon of a fax (from an OLE-compatible fax application) and drop it onto the Calera WordScan icon to initiate the OCR conversion.

WordScan 2.0 and WordScan Plus 2.0 are available through Calera's distributors for \$299 and \$395, respectively. Both products require 4M bytes of random-access memory, a 386-class or higher PC, DOS 5.0 or above and Microsoft Windows 3.1.

An upgrade policy for current users of WordScan is available through Oct. 31.

All OCR vendors are grappling with how to do accurate recognition of hard-to-read documents.

Software integration

CONTINUED FROM PAGE 41

These efforts will eventually lead to the creation of truly context-sensitive software that to some degree will anticipate what a user is trying to perform.

As part of that effort, users will probably see dramatically changed user interfaces. Rather than being presented with a large selection of icons and menus, they will see a series of cascading icons that are brought into play as the user moves through a task.

Typewriter mentality

"We're at the beginning stages of rethinking what a word processor should look like. Word processors were modeled after typewriters, but now we can look at how we actually use documents," said Bill Jones, Lotus' director of product management for the Ami Pro spreadsheet.

In fact, intelligent software is likely to incorporate sophisticated logic that will provide the cognitive ability to check the logic of a piece of text and to incorporate speech recognition. With this in mind, Microsoft has a five-

year project aimed at incorporating speech recognition with Office, said Chris Peters, Microsoft general manager for Word. This capability will be supplemented by a cognitive reasoning capability.

For example, Peters said Microsoft has a prototype Word application that knows about 100,000 facts about the world, taking up about 16MB of random-access memory. Microsoft hopes to teach the software the relationship among these facts, while also reducing the resources required to support this capability. Microsoft plans to then create more sophisticated grammar checkers that could evolve into devices that can essentially take dictation.

"Up until now, all the enhancements in processor speed have gone into the user interface of the application. But people don't want to learn software, so we have to make these machines easier to use," Peters said.

The challenge for software vendors will be to make effective use of hardware to accomplish these goals.

"These kind of features require very high linguistic and computational capabilities," Jones noted.

"The concept of having the computer do a lot of the thinking is the way the industry is going," LePevre added.

Aldus Corp.'s consumer division has announced Aldus IntelliDraw 2.0. According to the company, IntelliDraw 2.0 is an upgrade to Aldus' cross-platform drawing program. It was designed for the Macintosh and Windows.

Version 2.0 enhancements include expanded file support and connectivity, new drag-and-drop templates and special effects for objects and text.

It enables users to create technical dia-

grams, business or engineering graphics, flow charts, organizational charts, space plans, architectural renderings and more. A new Attribute Control Panel monitors and alters the size, position and line attributes of an object, the company said.

The Macintosh and Windows versions of Aldus IntelliDraw 2.0 will be available during the fourth quarter and will cost \$199.

Is there a way to net
branches without

work your company's shaking the tree?

So you've got PCs in your branch offices just waiting to be networked. But you're waiting for a solution that won't involve four different products, four different vendors, and forty days and nights of training just trying to get it all to work together.

Introducing NetWare Branch Office Solutions, the first integrated networking package for branch office PC environments.

Now, without going out on a limb, you can network your branch offices, link them to each other and to your corporate network, and manage it all from one location. Training and support are simplified, too, since Novell is the only company you need to work with.

For additional information and a free video, give us a call at 1-800-554-4446.

■ NOVELL. The Past, Present, and Future of Network Computing.

NetWare Branch Office Solutions

Everything you'll need to network your branch offices, in one integrated, easy-to-manage package. Includes file and print sharing, gateway and routing features, intelligent hub, messaging system and centralized system management tools. Available in SNA and internetworking versions.

"I've Had It."

We're Getting Hayes OPTIMAs. They're Affordable.
They're Dependable. I Can't Go Wrong."

As modem prices continue to drop, it's important that reliability doesn't. With the OPTIMA™ family, you can count on the quality of Hayes at very affordable prices. Data modems. Data plus FAX modems. Board versions. Even portables. With speeds from 2400 to 14,400 bps, OPTIMA is Hayes quality at a surprisingly low price.

SPECIAL FEATURES. OPTIMA's Automatic Feature Negotiation selects the best combination of data speed, error-control, and data compression for throughputs of up to 57,600 bps to save big bucks on phone charges. Hayes' AutoSync eliminates the need for buying special adapter cards to communicate with PCs and mainframes. And to help avoid problems like data interruption and compatibility,

OPTIMA includes the Hayes patented Improved Escape Sequence with Guard Time and Hayes Standard AT Command Set. Just some of the features that helped Hayes win the Computerworld 1992 I/S Brand Preference Award in 8 categories.

EXTRA BENEFITS FOR YOU. All this low-priced reliability is packed with our famous Smartcom™ software to help you communicate easily in minutes. And it's all backed by a fast, efficient Hayes Technical Support team. Call 1-800-96-HAYES for your nearest dealer or product literature. In Canada, call 1-800-665-1259. Hayes quality, low prices, and peace-of-mind.

Think OPTIMA...from Hayes.

NEW PRODUCTS, 59

SunSoft boosts NFS features

By Jean S. Beaman
MOUNTAIN VIEW, CALIF.

SunSoft, Inc. has launched the first rewrite of its Network File System (NFS) in five years, revamping overall system performance and security of the distributed file system.

The software, which supports distributed computing among Unix workstations, PCs, Novell, Inc. NetWare-based servers and IBM mainframes, among other systems, should be installed at user sites in 1994.

Industry analysts said Sun is making the move to keep NFS current with the Open Software Foundation's (OSF) Distributed File System (DFS) and the Andrew File System used by some systems vendors. Major systems vendors, including IBM and Hewlett-Packard Co., began shipping DFS as part of OSF-compatible Distributed Computing Environment tool kits this summer.

NFS Version 3.0 could be installed as an upgrade at hundreds of thousands of NFS sites worldwide, industry analysts said. Among key improvements, Sun said, are better performance, support for high-bandwidth networks, reduced server overhead and enhanced security.

Several analysts said client/server response time will be improved by NFS Version 3.0's expedited handling of routine confirmation messages. "Not having to wait for the confirmation that a 'write' was completed will speed things up," said Paul McGuirk, a Gartner Group, Inc. Unix analyst. Security has been improved with a new authorization process for client machines.

Easy upgrade?

Users want to be able to upgrade easily to Version 3.0—something they cannot put to the test until systems vendors offer NFS-compatible products next year. But initial results were positive. "It's got a lot of features that improve its reliability and its speed," said Stan Hawks, president of the Sun User Group and president of Technology Transfer Associates in Houston. "Right now, doing a write in NFS is about equivalent to scratching your nose by reaching around your back and over your shoulder. You've got to send a lot of different server requests and wait for them all to clear."

Users critical of security lapses at some sites have blamed weaknesses in NFS. Those who have seen early versions of NFS 3.0 said Sun has added Kerberos security software and tightened access to remote servers.

Key distribution

SunSoft estimates
there are approximately 4 million users worldwide who access files in distributed systems using Sun's NFS software. NFS is a key component of the Open Network Computing distributed computing software in SunSoft's Solaris 2.x operating system.

Where does all the data go after your groceries have been checked through the supermarket scanner?

It usually ends up in a very large mainframe database at one of a handful of market analysis firms that sell the accumulated information to produce manufacturers and retail grocery chains [CW, May 31].

One of those suppliers, Information Resources, Inc. (IRI), provides a data service called InfoScan that draws on consolidated sales data from more than 2,800 supermarkets. The resulting database at IRI headquarters is about 1.7 terabytes. Stored on IBM-compatible mainframes, the data can be accessed by end users via a custom client/server application called Express that runs on PCs.

Stringing up the data

Now IRI is launching a way to provide those data "slices" to retailers without first having to process the accumulated sales data from thousands of stores. Early this year, it began deploying a Unix workstation to give grocery-chain managers a window on chain-specific data. That data shows sales patterns in sales at each of the chain's stores and includes a built-in decision-support

port database for grocery store managers (see diagram below).

A retailer's merchandising business unit uses the Unix system, based on an IBM RISC System/6000 workstation, to pipeline products as winners or losers in the race for shelf-space placement. Because profits in the grocery business are just a few percentage points of total revenue, a detailed and timely

installing Unix servers and PC clients is one way \$276 million IRI hopes to build market share in grocery stores, where demand for such data is booming.

The decision-support software allows managers to fine-tune supplies to local shopping patterns. IRI already has an extensive customer base for its mainframe services at the manufacturing giants that supply soap, soft drinks and canned goods to retail outlets, as does its arrival, A.C. Nielsen Co. in Northbrook, Ill.

IRI executives said the move to Unix servers for in-store analysis stems from the workstations' capacity and speed, compared with PC servers, and from the portability of Unix code to many types of hardware used worldwide. But competitive pressures are also a factor; as other firms move to supply retail chains with in-store decision-support applications.

Future Unix-based QScan system is in use at 20 sites and is expected to be in place at more than 75 sites by year's end. Several IRI users refused to comment publicly on the Unix systems they are evaluating or installing, citing competitive concerns. Among them are major grocery chains in Chicago and Los Angeles, industry sources said.

Databases

Help sources multiply

By Kim S. Nash

Database users looking to go client/server have more sources than ever from which to buy software and consulting help as firms such as Sybase, Inc. and The ASK Group, Inc. sign up systems integrators, value-added resellers (VAR) and other third-party vendors.

More choice means users can better tailor consulting packages to individual projects. For instance, for a major, multidatabase client/server initiative, a user may want to call on a systems integrator directly instead of Sybase or ASK, to ensure dedicated,

full-time help. In creating a smaller departmental system, on the other hand, users might be able to get away with buying a contained, turnkey application from a local reseller.

VAR partners

Sybase and The ASK Group's Ingres Products Division recently outlined plans to add at least 200 VARs, integrators and independent software vendors to their partner lists during the next year. Sybase, for example, recently announced an agreement with SHL Systemware Ltd. under which SHL will resell Sybase SQL Server databases and related products.

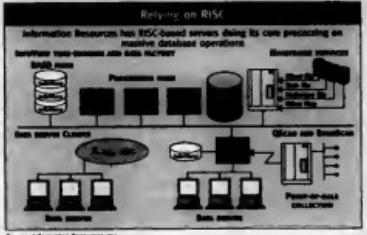

Channel sales are growing faster than direct sales right now, in part because customers are looking for customized consulting help as they plow into unfamiliar client/server territory, according to Bill Shattuck, an analyst at Montgomery Securities in San Francisco.

Although Sybase and others are smart to strengthen indirect strategies, the moves "aren't crucial" in the near term, Shattuck said.

Sybase and Ingres want to expand both the high-end systems integrator side of the indirect market and the low-end independent software vendor arena [see chart page 58].

Plus, the firms plan to partition off a section of staff to deal only with partners. Ingres plans to add about 90 people.

Help sources, page 58

analysis can boost profits, said John C. Matthei, vice president of data systems at IRI, who heads the firm's applied technology group.

The new Unix-based QScan system is in use at 20 sites and is expected to be in place at more than 75 sites by year's end. Several IRI users refused to comment publicly on the Unix systems they are evaluating or installing, citing competitive concerns. Among them are major grocery chains in Chicago and Los Angeles, industry sources said.

Workstations, page 58

Xerox unit brings mainframe publishing tool to PCs

By Michael Vizard
SAN DIEGO

Looking to leverage the horsepower available on desktops in order to run a publishing application more economically, Document Sciences Corp., a unit of Xerox Corp., has ported its mainframe-based publishing software to PCs running Microsoft Corp. Windows.

The migration of the high-end Compuset publishing package, which is aimed at high-volume applications that normally would have required typesetters, is driven by the desire to offload as many applications as possible from expensive mainframes.

Document Sciences President Tony

Domini said he expects most of his current customers to deploy PCs essentially as coprocessors that will be used to create documents. The documents will then be transferred to mainframe systems that have more sophisticated print-spooling software to drive high-volume printers.

To create these documents on PCs,

Document Sciences has provided the Compuseries, a set of design tools that work under Windows. These tools include CompusBuild, which enables users to view documents before they are printed; CompasMerge, which is a style generation tool; and CompusMerge, which sets rules by which elements of a document can be merged with other types of information.

Finding new customers

However, while Document Sciences is predominantly targeting its existing base of 600 sites for the PC version of the product, the company is making some headway with customers who did not have Compuset running on a mainframe before they adopted the PC package.

Chain Store Guide, a unit of Lebhar-Friedman in Tampa, Fla., that publishes directories of retail stores, recently adopted Compuset on a 68-MHz 80486 from Dell Computer Corp. to speed the process by which it publishes 20 1,000-page directories each year.

"With Compuset, we can print a 1,000-page directory in 12 minutes and index it in another 15 to 20 minutes," remarked Mary Barnich, manager of new technologies.

Barnich said the adoption of Compuset means Chain Store Guide can now move toward a publishing on-demand business model that will allow it to create segments of its directories for specific markets. Following that effort, Barnich said Chain Store Guide will begin looking at distributing those directories on CD-ROM drives.

"Essentially, we're moving toward periodic updating. Compuset was the fastest and easiest to learn of the packages we looked at. With other packages, the learning curve was too high, or we would have had to pay someone to come in and build one for us," Barnich said.

Specifically, Barnich said, Compuset was easy to learn because its typesetting commands are based on derivatives of standard publishing commands.

"It also gives us tools to view the documents in a Windows environment," she added.

The industry's strategy has been to offer a simplified, user-friendly application to expand into manufacturing.

What difference does IT make?

structure. IT is software and information processing. Systems integration and network communications. Supercomputing and desktop publishing. And much more.

IT's the industry that last year included five of the six fastest growing segments of the U.S. economy, with a growth rate in excess of 13 percent.

And Information Technology brings it all to bear for a better bottom line. By an express delivery company using IT to streamline package routing. By an aerospace company using IT to model a next generation airliner and avoid a full-scale mock-up. By a baking company using IT to cook up millions of dollars in sales force productivity gains.

The bottom line: Information Technology can mean the difference between running a business, and being run out of business. When you think about it, IT makes a major difference. To learn more, call ITAA at (703) 284-5326.

Ludwig van Beethoven

Buddy Holly

With the new IEF for Client/Server they could play in harmony.

IEF
*As revolutionary for
information systems
as notes were for music.*

Based on IEF
the number one
integrated
CASE tool in
the industry.

Model-driven
flexibility.

The new IEF for Client/Server is as revolutionary for information systems as notes were for music. Like sheet music does for musicians, the IEF for Client/Server provides common access to structured, rule-based information. Just as a quarter note by Beethoven means the same as one by Buddy Holly, this new application development system provides common meaning to different client/server systems.

Built on a 5-year track record, market leadership for rapid application development tools, and a customer base that includes 50% of the Fortune 100, the IEF for Client/Server can help integrate the desktop, midrange and mainframe for unparalleled performance.

The entire application, including client, server and all communication components are developed and maintained as a whole from within a single IEF model. What's more, components can be reused in new client/server applications and deployed across different environments for encore performances.

Because analysis and design activities aren't restricted by the execution environ-

ment, developers can focus on defining and satisfying their individual business requirements without worrying about technology constraints.

The IEF for Client/Server allows in a single specification the flexibility to generate complete applications for a variety of execution and database platforms.

Which means that you can go horizontally, vertically or cross-enterprise on systems such as Microsoft,TM HP,TM IBM,TM Sun,TM NCRTM Sequent,TM Tandem,TM Digital,TM Oracle[®] and Sybase.[™] All without missing a beat.

The IEF for Client/Server enables your business to rapidly respond to change which, in turn, increases your competitive position in the marketplace. And that's not all. TI offers products and services that effectively reengineer business processes and transition legacy systems to client/server technology.

All so you can extend your company's reach. And enjoy the sweet sound of success. For more information on the new IEF for Client/Server, call 1-800-336-5236, extension 1424 today.

Easier

ple this summer dedicated to working with outside partners, bringing the total to 41, said John Humphreys, channels marketing manager.

Likewise, Sybase has built special product training and technical support programs dedi-

cate to third-party partners, said Carole Louis, Sybase's channels development group manager.

Commission revamp
Both companies said they are revamping the commission structure of their respective sales forces to encourage cooperation with outside partners. For example, one part of Ingres' Management By Objective plan calls for paying sales representatives as the VARs they work with

reach specific milestones in end-user sales, Humphreys said.

Overall, as the newly expanded indirect strategies take hold, a division is likely to emerge between the kinds of customers who buy from resellers and those who go through database vendors directly, Shattuck said.

Corporate information systems groups

equipping their firms for large-scale enter-

prise-size projects prefer to work directly with

software and hardware companies.

Departmental-level project managers historically do more business with VARs and independent software vendor selling turnkey systems, he explained.

That phe-

nomenon, database makers assert, is not to rely too heavily on

one avenue or the other in the market share race.

Informix Software, Inc., which has traditionally depended on resellers to move its products, has made a concerted effort during the past two years to go or beat up direct sales.

Chief Executive Officer Phil White told attendees at the company's annual user conference last month that direct sales surpassed indirect for the first time this year as a percent of total revenue.

Unix systems are a "right-sizing" alternative to mainframe database systems that cost less to build and to operate, industry competitors said.

"A Unix solution gives you more bang for your buck," said Bill Alton, national sales manager at start-up Alli Group, Inc., an IBM competitor in Manhattan Beach, Calif.

"You put your big database on Unix servers, and you've got horsepower that you could only replicate on a mainframe, and at much higher cost." Meanwhile, end users can access the Unix server's databases from their desktop PCs, Alton said.

Mather said the Unix servers are already proving to be cost-effective. It takes fewer people to

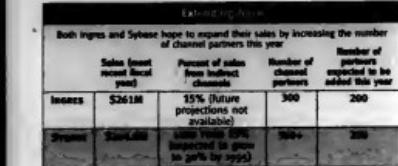

develop Unix code than mainframe code and less time to complete projects. The Unix QLogic project began only last year.

"We're growing our business at 20% or more a year, and we're trying to keep our support costs from growing at that same rate."

Off-the-shelf
Off-the-shelf Unix servers have the potential to offload some of the data processing from IBM's five IBM-compatible mainframes.

"We believe the mainframe has a well-defined place in our architecture and will for the foreseeable future," said Ned Heinrichs, president of IBM's Data Systems Division. "But

we're attempting to stem [its] rate of growth because it's three to four times more expensive."

cated to third-party partners, said Carole Louis, Sybase's channels development group manager.

Hardware

Winchester Systems has announced FlashServer, a family of controllers, disk subsystems and file servers.

According to the company, the family targets Novell, Inc. NetWare and Unix networks with growing user populations and client/server applications that demand data reliability and high-performance servers.

FlashServer achieves 6,000 I/O operations per second by combining redundant arrays of inexpensive disks reliability and multichannel, multiprocessor I/O performance, the company said.

Prices start at \$6,075.

Software

Unidata, Inc. has started shipping Release 3.1 of the Unidata relational database management system and application development environment.

Pull standards-based integration with

third-party PC client-side interactive tools is provided, according to Unidata. On the server side, Unidata Release 3.1 was designed to offer full access to Ingres Corp., Informix Corp., Oracle Corp. and other databases, the company said.

Prices range from \$515 to \$610 per user.

► **Unidata**
Suite 3060
909 18th St.
Denver, Colo. 80202
(303) 294-6800

Network Imaging Corp. has announced its Hierarchical Storage Manager client/server software.

According to the company, the software automatically migrates the oldest inactive files on a PC hard disk to file libraries stored on tape or optical-disc storage systems attached to either Novell, Inc. networks or Unix.

A file can be accessed and retrieved once it has migrated to the file library and transported back to a magnetic hard disk, providing users with instant access to information.

The software is capable of reducing on-line data storage costs by 70%, the company said.

Prices range from \$15,000 to \$60,000.

► **Network Imaging**

Herndon, Va. 22070

(703) 475-2260

Product shorts

General Automation, Inc. has released the A500 and the A500XL computers, two additions to its Advantage Series family. The products are offered in compact tower enclosures and include the R81 Enhanced Pick Application Environment, its advanced implementation of Pick Systems' Pick relational database system. Cost: The A500 is \$65,000; the A500XL is \$109,000. General Automation, Tazewell, Calif., (818) 757-0070. ... Share Software Corp. has introduced Sires Editor, a multi-based text editor that runs on several Unix platforms. It has a shell facility, multi-line window management, a column-mode editing capability and auto-save, auto-backup and auto-recovery facilities. Cost: \$249. A five-user license is \$1,795. Share Software, Menlo Park, Calif., (415) 322-0600. ... Bluering Technologies, Inc. has announced Optix PC View, Windows client software for the Optix Network Multilink electronic document management system. According to the firm, the product enables IBM-compatible workstations running Windows to access the Optix Network Unix/SQL-based document imaging and text server. Cost: Starts at \$75,000. Bluering Technologies, Flint Hill, Va., (703) 675-3015.

THERE'S NO QUESTION ABOUT OBJECT-ORIENTED NEXTSTEP THAT \$299 WON'T ANSWER.

If you're a developer of mission-critical custom applications, you've already heard the talk about object-oriented software. It's time you experienced the real thing: NEXTSTEP for Intel® 486 and Pentium® processors is here.

For a limited time, you can get the whole system — developer and user versions — for only \$299. (Quite a deal, considering these versions alone retail at \$795 and \$1,995 respectively.) And this isn't some watered-down

version of NEXTSTEP. It's the real thing. Fully functional. Including all the tools you need to develop and run your custom applications on industry-standard hardware. This offer even includes all of the informative and money-saving extras you see to the left.

To order your own NEXTSTEP Evaluation Kit, just call 1-800-TRY-NeXT. You'll find out why so many people are calling it the most advanced software in the world. No question.

OFFER EXTENDED UNTIL
SEPTEMBER 30, 1993

1-800-TRY-NeXT

Yesthe deadline is real. But so is our offer. Order our Evaluation Kit for only \$299, and we'll send you the complete, fully functional, object-oriented NEXTSTEP for Intel processors. This offer includes both the user and developer versions, full NEXTSTEP development tools and all extras described in this ad.

NEXTSTEP Evaluation Kit. You'll find out why so many people are calling it the most advanced software in the world. No question.

Hewlett-Packard computer systems helped Spalding's worldwide revenue grow four times faster than the industry average.

"Our HP 3000s have taken the worry out of daily operations and future growth. They leave us free to concentrate on customer service."

— Ward White, Spalding's CEO and Worldwide Director of MIS

Instead of investing in mainframes, Spalding looked for a better way to manage its growing business. A way that would make the 115-year-old sporting goods company more responsive to customer demands around the world and save money at the same time.

So HP developed a networked solution built around powerful HP 3000 Business Systems in a dozen data centers and distribution hubs worldwide. This gives Spalding instant global access to management information, helping them react quickly to changing consumer needs, and deliver products faster.

To learn more, call 1-800-637-7740, Ext. 7460 for our free video, *Strategic Computing*, starring some on-the-ball business leaders. It shows why you might want to rethink your company's game plan.

Think again.

STRATUS' UNIX TO ACT AS
HOSTS FOR SNA, 64
NEW PRODUCTS, 66

Wireless starts to rival fiber speeds

By Joanie M. Wexler
EWEEK

Users worried about traditional low-speed wireless technology's ability to handle tomorrow's bandwidth-guzzling applications may find solace in the promise of emerging wireless technologies represented by fiber-optic capacities.

CellularVision of New York, Inc., for one, plans to soon roll out its 1G b/sec. wireless network, also called CellularVision, in the New York area. Regional Bell operating company Bell Atlantic Corp. will operate the network, the firm announced earlier this month.

CellularVision affords high enough speeds for interactive cable televisions and other multimedia applications, according to the vendor. The company's

ability to deliver the technology is the result of its success in managing large amounts of bandwidth in the 2.5-GHz frequency range from the Federal Communications Commission last December [CW, Dec. 21, 1992].

The spectrum had been reserved for point-to-point communications but was largely sitting idle, said Bernie Bossard, company co-founder and inventor of the CellularVision technology.

CellularVision already provides wireless TV services to 200 customers through a test in Brooklyn's Brighton Beach for \$29.95 per subscriber. Plans within two years to cover 75% to 80% of the New York territory for which it has a license, said Shaan Hovanian, CellularVision president, who added that the company hopes to begin commercially

marketing services next year. The area includes the five boroughs of New York and a few surrounding counties.

"This is an electronic superhighway alternative for New York customers who have not been supported up to now," Hovanian said.

Business issues

However, for business, it might be "difficult to operate on a consistent basis," said Jeff Marshall, senior managing director of communications technology at Bear Stearns & Co., a New York brokerage firm.

This is because there are security issues surrounding the integrity of the bandwidth, Marshall said. "We need some guaranteed delivery mechanism" regardless of whether lightning or other havoc-wreaking weather conditions strike, he explained.

Marshall did say, however, that high-speed wireless "might make a good alternate route" for backing up cable networks and should serve the last leg of residential cable routes "where fiber leaves off at the curbside and wireless

goes into the home."

Meanwhile, Zenith Electronics Corp. in Glenview, Ill., demonstrated its Z-View protocol, formerly used for real-time interactive services running on cable networks, over the airwaves at the Wireless Cable Convention in Orlando, Fla. The firm demonstrated a two-way video-on-demand ordering application that traveled 16 miles each way in about five seconds.

Zenith expects to have its 45K b/sec. technology deployed internationally in production networks within six months, said Barry Harder, product manager for Zenith's Cable Products Division.

Harder said the main reason for using wireless as a cable alternative is its dramatic cost savings. He estimated a new enabling system would cost about \$1,300 per subscriber to build, while a wireless version would run about \$500—savings that would presumably be passed on to subscribers.

Zenith also demonstrated a prototype of a module attached to a home computer for wireless processing. Prodigy Services Co. bulletin board services.

Diagnostic agents to tie to central console

By Elisabeth Horwitt

AHARDY network administrators may find relief in a trend toward the linking of increasingly intelligent local-area network diagnostic agents to domain and enterprise network management systems.

The idea, which is not quite reality for most products, is for such agents to act as local monitoring and diagnostic systems for our own organization, gathering valuable data about the state of LAN traffic, error levels and devices and returning it to a network administrator's console.

ProTools, Inc. recently announced that its Network Control Series LAN diagnostic tool will be able to provide high-level LAN diagnostic information to IBM's NetView/32000 and LAN NetView, Hewlett-Packard Co.'s OpenView, AT&T Networks Corp.'s StarSentry and Unisys/Unibase, Inc.'s Windows and Unix-based NetDirector.

The Beaverton, Ore., vendor's Cornerstone Agent uses the Remote Network Monitoring (RMON) protocol to monitor LAN segments. A diagnostic engine can act as a stand-alone management system, analyzing the information collected and sending key alerts up to a central enterprise management system such as OpenView, according to ProTools President and Chief Executive Officer Ed Snyder. The engine can also send diagnostic data to ProTools' own domain network manager, Foundation Manager.

Getting smarter

ProTools is also working to add intelligence to its Network Analysis Engine, which sits on its Foundation Agent and does local processing of LAN data, Snyder said. The engine will be able to interpret incoming diagnostic information about all seven layers of the protocol stack with increasing intelligence. For example, it will determine that an error at the user layer means a printer just went down, Snyder said.

Diagnostic agents, page 65

VSAT system offers bridging, routing

By Gary H. Antes
ATLANTA

Scientific-Atlanta, Inc. announced a VSAT satellite system geared for wide-area networking among heterogeneous local-area networks.

The company said its very small aperture terminal (VSAT) system,

in Atlanta said, companies buying it are also likely planning to add broadcast video and audio communications to their data networks, according to the firm.

The satellite-based system supports Ethernet and Token Ring LANs and is the first VSAT product to provide both bridging and routing capabilities. The SkyRelay

for the "bursty" traffic typically seen in LAN interconnections.

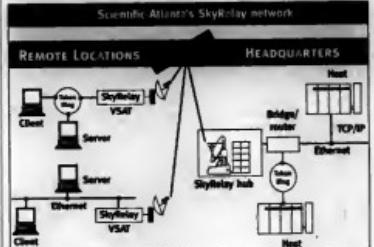

The product includes network management software for automated command and control, performance monitoring, traffic analysis and trouble ticketing, all consolidated on a single Unix workstation.

SkyRelay systems can be configured to provide up to 256K b/sec. bandwidth outbound from headquarters and up to 128K b/sec. for inbound traffic. In addition, optimization features allow for "bandwidth-on-demand" to economically budget for peak transmission needs, said John Russell, marketing manager.

Russell said Scientific-Atlanta will sell SkyRelay as a turnkey wide-area network. It said a company with 500 locations would spend \$300 to \$400 per month per location for SkyRelay, assuming a five-year amortization of hardware and software and a normal allowance for recurring costs such as operations and maintenance.

That cost estimate assumes a representative mix of communications, including interactive traffic, client/server applications running over the network, file transfers and downloads and messaging.

SkyRelay will be available by year's end. There is one beta-test user, a retail chain with 200 to 250 outlets, but Russell declined to name the company.

called SkyRelay, was designed especially for companies with distributed computing at 100 or more sites, including firms in the retail, automotive, distribution, financial and travel services industries.

SkyRelay will support mission-critical applications requiring remote file access, file manipulation and large file downloads. Scientific-

bridge/router supports a number of internetworking approaches such as source routing, transparent bridging and Internet Protocol routing.

SkyRelay uses a frame-relay backbone protocol that the company said is more efficient than the X.25 protocol used in an earlier VSAT product. It is ideally suited

Stratus' Unix systems to act as SNA hosts

By Craig Stedman

Stratus Computer, Inc. plans in the first half of 1994 to add capabilities to its Unix-based fault-tolerant computers enabling them to act as full hosts in IBM Systems Network Architecture (SNA) environments, where Stratus machines are now used mainly as front ends to main-

Stratus hopes the Primary SNA support will position its high-end XA/R Unix systems as downzoning platforms for off-loading mission-critical mainframe applications. That would complement a new low-end client/server strategy that the company embarked on this month.

Full SNA support has been built into Stratus' proprietary VOS operating system for several years, but that is not all.

**Full speed
ahead**

Stratus' FTX Unix derivative is expected to account for 20% to 25% of sales this year and become a larger seller than the proprietary VOS operating system in 1994, said Stratus.

1995, new carmine Babcock, vice president of corporate marketing, FTX should become "very comparable" in functionality to VDS within six to nine months, she added.

competition at the front-end level," noted Richard Schreiber, president of ATB Associates, Inc., a Wellesley, Mass., consultancy. "They're trying to carve out a new niche for themselves" with the host strategy, he said.

Target VOC

Schreiber and other analysts were uncertain how much downizing business Stratix will attract. Peter Kastner, an analyst at Aberdeen Group in Boston, said he expects the main target market for the Unix SNA products through 1994 to be Stratix' own VOS installed base.

However, he added that VOS customers still appear to be concerned about the reliability of Stratus' FTX Unix derivative, despite the company's rewriting of the Unix kernel to make it more robust. "The answer we hear is 'Show me,'" Kastner said.

"Whether justified or not, FTX is regarded as less reliable," agreed Omri Berlin, publisher of the "FTX Systems" newsletter in Los Altos, Calif. "And if FTX is not perceived as rock-solid, that kind of blows away the whole marketing rationale" for using it as an SNA host.

A VDS user at a major U.S. bank, who

asked not to be identified, said he has no plans to switch to FTX, partly because of the reliability issue. The bank is not having problems with the VOS version of SNA, but still views the Stratus machines as best-suited for front-end uses, he added.

Stratus officials said they hope to make FTX as reliable as VDS in the next

release. Initial SNA capabilities were introduced this month for FTX such as FTX Secondary SNA, which allows Stratux systems to act as a remote 3270 cluster controller, and FTX APPC, which supports IBM's Advanced Program-to-Program Communication (APPC) protocol.

SNA software due out next year are based on SNA code licensed from IBM. Carlson said Stratus is developing its own network routing software for controlling terminals and printers attached to mainframes from an FTX-based system. That software is also due out in the first half of 1994, she said.

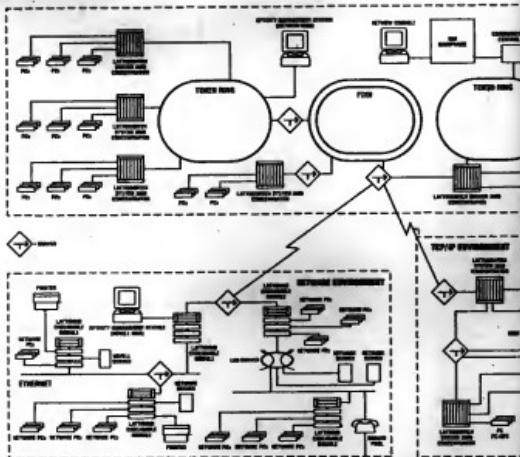

Clean up

Network management can get messy—especially when you have multiple environments. Fortunately, the people who helped you build your network have a cleaner way to manage it all.

SymOptics is a natural choice for network management. We not only pioneered the intelligent hub, but we were the first to provide integrated SNMP management in Ethernet, Token Ring and FDDI networks. As a result, we've

become the hub of network management for over six million users worldwide.

With SymOptics, your whole approach to network management is cleaner. Our Optivity™ and LatentWare™ software solutions support all major network technologies, as well as emerging ones like ATM, B-ISDN, NetWare, TCP/IP, or a mix of all three, our customized solutions handle it all. For example, we've integrated Optivity and LatentWare

Diagnostic agents tie to central console

CONTINUED FROM PAGE 63

This high-level interpretation can be of use to companies that cannot afford to put a network expert at each LAN segment. It also can save bandwidth by sending the results of diagnoses, rather than raw diagnostic data, Snyder said. The data can be sent directly to the databases

of the enterprise network management system or can be displayed on its console.

Rochester Gas & Electric Corp. currently uses two Foundation Managers and 12 Agents. The distributed diagnostic system was a welcome change from

ProTools' early portable diagnostic tools, according to Al Oliver, lead analyst for the Rochester, N.Y., utility. "The interface is easy to use and even when you have an intelligent person to do the analysis, [the bid product] required that person to throw it over his shoulder and wander hither and yon" to fix problems in distributed LAN segments.

With the Foundation Manager and Agents, Oliver said, "I can sit at my desk and perform analysis on an operations

miles away." Also, the Agents generate alarms in real time and use history logs to capture snapshots of Ethernet and Token Ring events according to preset parameters, so Oliver can do trending, he said.

The utility is currently evaluating which enterprise network manager to implement, with IBM's LAN NetView an OS/2 LAN management system, a strong contender, Oliver said. He is currently using the OS/2 version of the ProTools product, which he said is easy to maintain using IBM's Configuration, Distribution and Installation product.

Still to solve, however, is the problem of updating and maintaining the distributed machines that run the diagnostics, Oliver said. ProTools promised to provide the ability to upgrade agents remotely with the upcoming Version 1.4, he added.

Does Windows and OS/2

The company also announced recently that Foundation Manager and Agents will support, besides the current Unix version, OS/2 and Windows 3.1 versions. This addresses those users who are accustomed to OS/2 or Windows and resist dealing with a Sun Microsystems, Inc. SPARCstation running Unix just to have local network management, Snyder said.

HP, Sun and Novell, Inc. are all working on similar systems of their own. HP's LANprobe, an RMON-based diagnostic tool, can feed information to OpenView. Over the longer term, a more intelligent LAN diagnostic tool from HP acquisition Metric, Inc., will feed data into OpenView, an HP spokesman said.

Novell's answer to user-distributed LAN diagnostic needs will be based on a long-promised RMON version of its LANalyzer product, which will feed into Novell's NetWare Management System (NMS), a Novell spokesman said.

Originally expected at Interop '93 Fall in San Francisco later this month, the product, which is said to be integrated with the upcoming NMS Version 2.0, is now likely to appear at the NetWorld show in Dallas in October, a Novell spokesman said.

Meanwhile, Network General Corp. last week announced Notebook Sniffer Analyzer, a notebook version of an expansion-board LAN diagnostic tool. The product enables LAN administrators to carry their LAN diagnostic tools in a much lighter-weight box that can also perform regular Windows and DOS applications, a spokesman said. It is due out next month, priced at \$9,995.

your act.

with all the leading open management platforms: HP OpenView™, IBM NetView®/6000, Novell® NetWare Management System™ and SunNet Manager™.

We view your network as a whole, not as individual technologies. And we've designed a management architecture that's flexible enough to grow as your network does, protecting your investment. The Optivity network management system will meet your needs today, and down the road.

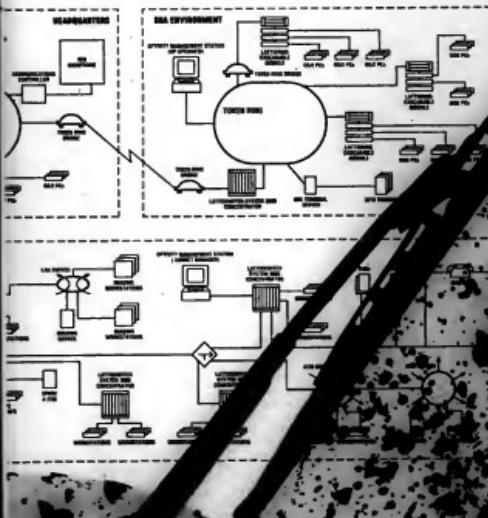

It's all part of our commitment to the network fabric, a managed, high-speed communications system

that supports new classes of enterprise and multi-enterprise applications. The network fabric expands and evolves as your business grows.

Now, if things are still a little muddy, just call 1-800-PRO-NTWK, ext. 13 or return the attached card for more information. We'll be happy to clear up any questions you may have.

Fibermax Corp. has announced five Token Ring I/O modules that increase user connectivity and the fault tolerance of networks built using Crossbow multi-local-area network hubs.

According to the company, the modules consist of two 12-port, unshielded and shielded twisted-pair cable modules, an all-fiber module and two mixed-media

modules that have 10 ports for user connectivity with fiber-optic ports for backbone connections.

The modules are said to increase overall availability and feature state-of-the-art retiming circuitry. Prices for the modules range from \$1,895 to \$1,995.

Dynex Communications, Inc. has announced TokenPrint and TokenPrint Plus, LocalTalk-to-Token Ring bridges designed to connect LocalTalk printers and other devices directly to Token Ring networks.

Up to two LocalTalk devices can be connected to a Token Ring with TokenPrint, and TokenPrint Plus will connect up to four LocalTalk devices.

Both TokenPrint and TokenPrint Plus have one DB-9 port for Type 1 Token

Ring, one RJ-45 port for Type 3 Token Ring and one mini-din 5 LocalTalk port. All types of LocalTalk devices are supported, with the exception of routers, the company said.

TokenPrint and TokenPrint Plus cost \$699 and \$899, respectively.

Paragon Computing, Inc. has introduced InterRoute5 and StarRouter, new versions of the company's high-performance LocalTalk-to-Ethernet hardware router/gateway products.

According to the company, InterRoute5 and StarRouter now support Apple Computer, Inc.'s AppleTalk Update-based Routing Protocol and Simple Network Management Protocol over AppleTalk, providing users with products that ease network management and enhance integration in larger networks.

Other new features include flexible seeding options. InterRoute5 connects as many as four LocalTalk networks to each other and to a backbone or Ethernet network. The StarRouter can connect 12 LocalTalk users to an Ethernet local-area network.

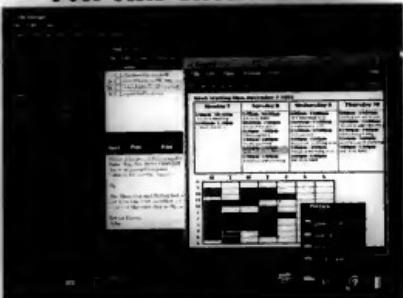

InterRoute5 costs \$3,499, and StarRouter costs \$3,299.

CC:MAIL NOT ONLY DELIVERS MAIL OF ALL SORTS, NOW IT DELIVERS MAIL ALL SORTED.

INTRODUCING cc:MAIL 2.0 FOR WINDOWS.

Now the most popular e-mail in the world is even more powerful. The new Lotus[®] cc:Mail[™] lets you manage your mail like you never could before.

THE NEW RULE-BASED ARCHITECTURE CHANGES THE FACE OF E-MAIL FOREVER.

With its powerful rule-based architecture, cc:Mail 2.0 gives you unlimited flexibility to control your mail. You can designate priority. You can reroute or automatically file

The dialog-driven rules editor lets you customize your mailbox to sort file and even reroute your mail—automatically.

incoming messages. And set criteria for handling outgoing messages. cc:Mail streamlines the way your e-mail works. Which helps you work.

THE WORLD'S SMARTEST E-MAIL IS ALSO THE WORLD'S EASIEST TO USE.

cc:Mail 2.0 has a new interface that's easier than ever to use with customizable features like a slider pane interface and smart Windows SmartIcons[™] let you move seamlessly into other Lotus applications. Plus powerful search capabilities and a built-in spell check that proofs your document automatically.

NOTHING SHOULD STAND BETWEEN YOU AND YOUR MAIL. AND WITH cc:MAIL, NOTHING EVER DOES.

cc:Mail works across all popular platforms, all hardware and software configurations, all WANs and LANs and e-mail systems. And cc:Mail has always featured unmatched scalability.

The convenient slider pane interface, similar to the Windows[™] File Manager, allows you to organize your mail easily.

cc:Mail allows you to send text, graphics files and faxes effortlessly, to e-mail users everywhere. Even on the road. Add to this cc:Mail's exceptional ease of installation and maintenance, plus its top-notch security features, and you can see why cc:Mail is the overwhelming choice of administrators and users alike.

And now, with rule-based architecture, cc:Mail sets a whole new standard. To learn more, please call 1-800-448-2960 and ask for a free demo disk.

How To Get The You Deserve With An Pixel Perfect

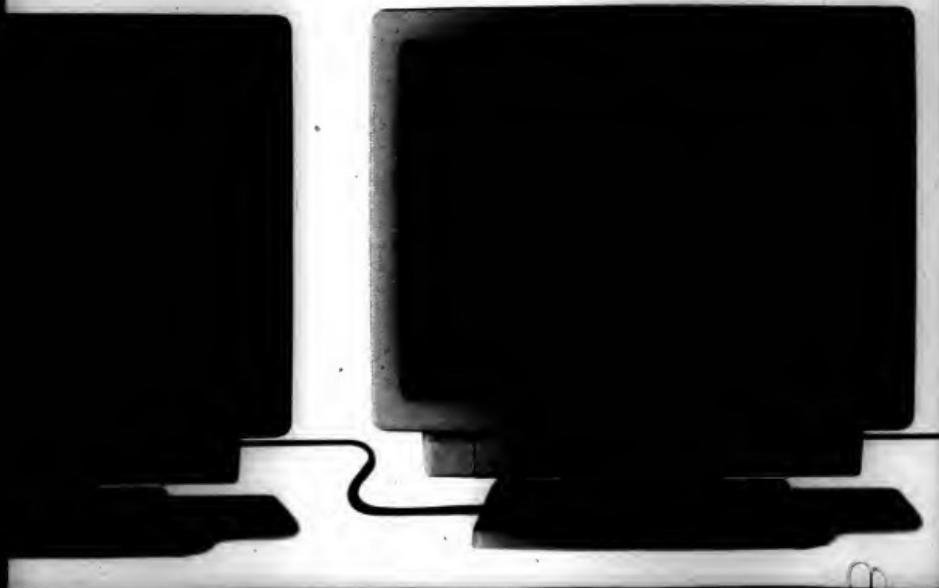

All of a sudden, it seems, management has set its sights on imaging. They now realize that in banks, insurance companies, hospitals, government agencies and businesses of all kinds—imaging is speeding up the processing of business forms. It's improving document control and customer service, enhancing productivity and making access to volumes of valuable information fast and easy.

Remembering the words "fast" and "easy," management turns to MIS directors and LAN administrators and says, "Get me *that*. Now!"

You know that "that" means workflow software, OCR software, scanners, muscular

microprocessors and high-resolution displays, all-points-addressable printers, magnetic and optical storage, plus the LAN-to-LAN horsepower required to move all that valuable information from desk to desk or across the country—now! To say nothing of project management, integration, security, backup and recovery, contingency, migration, multiple concurrent image users, and expansion.

If all that does not add up to "easy," we hope it suggests that you call us "fast." Standing by our phones are the people who know the most about end-to-end imaging solutions—Amertech Team Data.[™] The best brains in the business of moving

The Recognition Imaging Solution That's End-to-End.

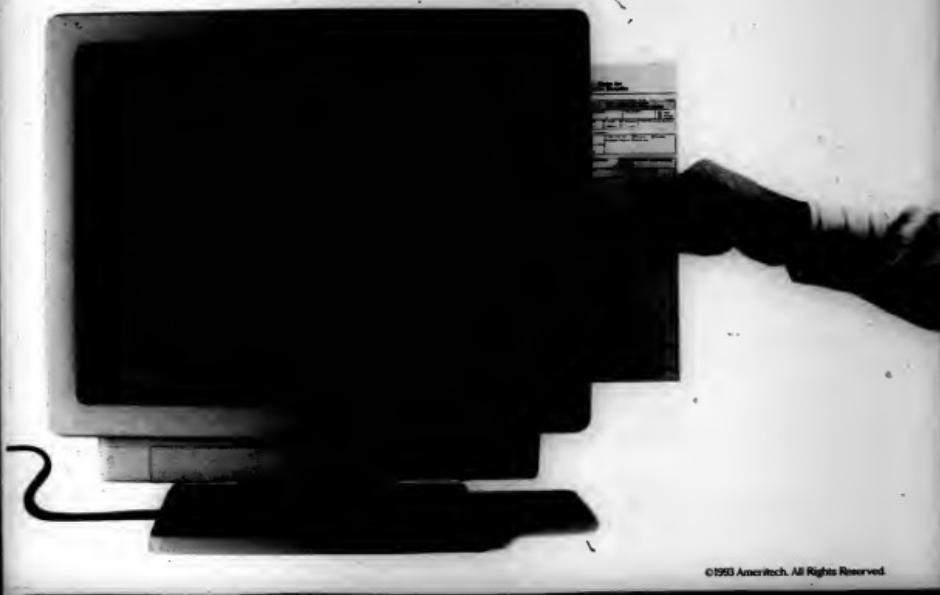

and managing data. They're your contact point for cost-effective, ready-now solutions. Which, in this case, include professional services, software, hardware, and high-end data-transport products like Ameritech® FDDI, Ameritech® SMDS and Ameritech® Frame Relay Service with enough bandwidth for instantaneous image response.

We think getting your management the right imaging solution will go a long way toward fulfilling the Ameritech commitment to apply our growing resources to enhance the quality of life, support education and spur economic development for all our customers. If it's time you got

the recognition you deserve, make the easy call to Ameritech Team Data. Fast.

Get out of the rough

Give users up to 200 times faster access to DB2® data

Avoid the I/O hazard

Wasting time and resources retrieving data on DASD can become a serious handicap. You need fast access to mission-critical information. And you need it now—without expensive hardware upgrades.

EXTENDED BUFFER MANAGER (XBM™), new from BMC Software, Inc., delivers the easiest and most cost-effective way to reduce response time. XBM's high-speed, dynamic caching subsystem gives users up to 200 times

faster data access. Most I/Os are eliminated, and the time is shortened to reach critical data, including indexes, work files and the DB2 catalog.

XBM helps you determine which objects should be cached and when by offering online and batch I/O information available only through BMC Software products. These data set level statistics can be used for reporting or simulation purposes. Then prioritize your data in the XBM cache. And keep DB2 performance out of the rough.

Proactive performance

EXTENDED BUFFER MANAGER is the newest addition to the integrated ACTIVITY MANAGER performance family for DB2. ACTIVITY MANAGER offers the only proactive approach to DB2 performance management. It includes exclusive interfaces between its three products—XBM, ACTIVITY MONITOR and OPERTUNE®.

Get out of the rough. For a free trial call BMC Software at 713 240-8800 or **1 800 841-2031**

Large Systems

IBM software helps mainframes back up non-IBM workstations

By Johanna Ambrosio

IBM has introduced a second software package that allows customers to use their mainframe to back up PCs and networks, even those not from IBM.

But there are some differences in the products, namely the platforms they run on and support, and their functionality. The newer of the two, called the Astar Distributed Storage Manager (ADSM), comes out of IBM's Astar storage unit. It runs on a range of nonmainframe platforms and allows customers to treat the backup data as they would any mainframe-generated data. In other words, the backup data can be

stored on mainframe-attached disk drives for a predetermined time and then moved to tape.

New feature

Customers can also preset backup times, so end users only need to leave their PCs turned on.

The older product, Workstation LAN File Services (WLFS), does not allow for such sophisticated data setup. Introduced by the Enterprise Systems Division that makes mainframes, WLFS provides basic backup in addition to other functions. These include centralized security for the attached workstations and allowing the attached local-area networks to share information by passing it through the mainframe.

Other differences include the platforms the packages run on and support. The older software, WLFS, runs under the IBM VM and MVS systems and supports DOS, OS/2, IBM AIX, Macintosh and Sun Microsystems, Inc.'s SunOS as clients.

The newer package, ADSM, runs under — or will by year's end — MVS, VM, AIX and OS/2 as servers. Clients supported include Novell, Inc. NetWare, ADOS, SunOS and Solaris, Windows, OS/2 and Hewlett-Packard Co.'s HPUX. The Santa Cruz Operation's SCO Unix will be added to the client roster in 1994.

Partnership support includes Oracle Corp.'s Oracle, Sybase, Inc.'s Sybase, Borland International, Inc.'s Paradox and dBase; and The ASK Group, Inc.'s Ingres, in addition to IBM's own DB2/E and DB2/6000 systems.

Pricing is also different. WLFS is priced at \$250 per attached server

per month, whereas ADSM is priced at \$420 per month for the server and \$5 per month for each attached client.

The data services manager at a large insurance company who requested anonymity, started using ADSM in May. Eventually, he expects to back up 2,000 OS/2 workstations with the mainframe; he now backs up 24. While things are going well with the product, he said, the process does raise some issues. Among them are performance and the need for additional disk capacity attached to the mainframe to handle the increased volume.

"What happens to the network when we're backing up 2,000 workstations?" he asked. "Especially if we do this during the day, in background mode on the PCs, how will that impact the interactive applications?" He added that one answer to that may be to do backups at night.

Betz Entec takes client/server plunge

By Mark Halper
BOSTON PA

In five attempts to jump the 20-foot waterfall near the end of West Virginia's rugged Big Sandy River, Betz Entec, Inc. information systems chief Anthony Martin has been tossed from his raft four times.

He said he hopes his success rate is a little higher as he leads his water-treatment chemicals company on a client/server plunge, an adventure he considers riskier than any of his white-water undertakings.

"If I miss the waterfall, I can get physically hurt, but I can't hurt my career," Martin mused in a recent interview at the company's headquarters here.

Martin's ideal rafting technique is not unlike his approach to the client/server implementation: Just as he likes to hit the waterfall with a rush to ensure an intact landing, he is picking up the pace on his efforts to rely less on Betz Entec's eccentric Hewlett-Packard Co. HP 3000 and to push more of the processing on to some 100 Novell, Inc. NetWare connected PCs in Horseshoe.

While many of the PCs already run the Windows operating environment, about 90% do not yet have Windows applications and are still running mostly under HP 3000 terminal emulation.

Picking up the pace

But an outburst of populist demand for Windows applications has quickened a three- to five-year conversion schedule into a one- to three-year plan. User hubbub spread after Betz parent Betz Laboratories, Inc. required all human resources users to tie into a Windows-based PeopleSoft, Inc. human resources application. People in other departments wondered why they, too, could not run programs that would cut down on the time they spent communicating with the HP 3000.

"They're tired of having to know so many different ways of accessing information," Martin said. By moving out of terminal emulation and into Windows, they can standardize on the Windows interface, he noted.

To facilitate the switch to client/server operations, Betz

Betz Entec's Anthony Martin says he hopes his client/server conversion is not as choppy as the Big Sandy River

Entec is replacing rudimentary terminal emulation software with a combination of Walker Kicher & Quian, Inc. software for emulation and Omnidesk, Inc.'s Omnidesk software, which permits multiple access paths to the HP 3000's HP Image SQL database.

Besides heading the call of the computing masses, Betz Entec has plenty of other reasons to convert to a distributed computing scheme.

As Martin noted, it is much cheaper to develop client/server programs using Microsoft Corp.'s Access database management system than by using expensive fourth-generation language (4GL) tools in an HP 3000 environment.

Martin said this became clear earlier this year when Betz Entec upgraded from an HP 3000 955 to a 957. With that change, 4GL supplier Speedware, Inc. charged as \$18,000 upgrade fee and \$25,000 extra for maintenance on the more powerful platform. In comparison, Microsoft charged \$400 per copy for Access, and Betz Entec needed only six copies.

Betz Entec will also save on hardware upgrade costs, Martin said, because it will have to beef up its HP 3000 less often — every seven or eight years instead of every three or four. Martin has two developers working full-time with Access on PCs, which has lightened the load on the HP 3000.

Still, old habits die hard. While Martin is easing the processing load on the HP 3000, he has no plans to sell it.

IBM shifts service units

By Thomas Hoffmann

Earlier this month, IBM quietly transferred its IBM Consulting Group from the company's application solutions unit to IBM North America, the firm's marketing arm. By doing so, Big Blue has effectively brought all three of its services divisions under a single mantle.

The move, according to observers, should eliminate much of the confusion that customers had earlier experienced when dealing with the IBM Consulting Group and Integrated Systems Solutions Corp. (ISSC), IBM's outsourcing unit.

In the past, customers had three avenues to go for service: IBM's trading area, for systems integration; IBM Consulting Group, for management consulting; and ISSC, for outsourcing services. Each of the three divisions regularly submitted bids on the same customer contracts, a process that was often baffling for clients, analysts said.

"It was very confusing for customers," said Julie Schwartz, associate director for professional services at Dataquest Worldwide Services Group in Framingham, Mass.

United front

Schwartz said she believes the new services arrangement will create synergies between the services divisions and will help customers differentiate between the range of services offered by each group. "Now, there will be a uniform front to the customer. The idea behind this is that there's more control over setting incentives so the competition [among divisions] doesn't happen," Schwartz said.

**TO TELL A
REAL NODE
FROM A
WANNABE
NODE,
READ
THE LABEL.**

INTRODUCING PCs DESIGNED SPECIFICALLY AS NETWORK NODES.

(And you won't pay through the nodes either.)

It's quite simple. If it says Dell NetPlex™, it's a real node.

Dell's new NetPlex systems are PCs designed from the ground up to be network nodes. The result is a far more cost-efficient node, remarkably free of set-up and maintenance hassles.

Works with your budget as well as with your network.

The cost savings up front are considerable. Our node itself is priced below any comparable PC offered by our competitors. And we save you time and resources by thoroughly testing NetPlex for network compatibility and then factory-installing your choice of six industry-standard network interface cards. We'll also run NIC diagnostics for you. And set jumpers. And install your choice from 100 of the most popular software applications. All this, accomplished with one P.O.

We've also made our NetPlex systems remarkably resistant to future shock. So six months from now when your users are demanding even more power, in their computers, our PCs will be happy to accommodate them. All systems can be upgraded using Intel's powerful i486® Overdrive™ processor. You can expand up to 32MB of memory. Or add a high-speed SRAM cache.

Customized customer service.

With Dell, you can pick and choose from a full menu of service options. We call it our SelectCare™ program. You may prefer the obsessively attentive 4-hour on-site service option. Or you may elect the highly responsive plan for self-maintainers. Likewise, you may want coverage for 5 years. Or you may settle for just one. The bottom line is, you pay only for the service you want, exactly as you want it. And not a penny for stuff you don't want or need.

When you do call us for technical assistance, you're guaranteed

help within five minutes, 24 hours a day, 7 days a week. Try finding that kind of service anywhere else. And since you deal directly with Dell, you get convenience and responsiveness other PC owners only dream of.

No dummies here.

Let's just get one thing straight here. Because we've made a node doesn't mean we've made any less of a PC. These are true high-performance business machines. Comparable to any of our major competitors' offerings. With block mode IDE transfer that makes for a veritable data rocket. And with local bus video performance that's on perpetual fast-forward.

What about reliability, you ask. Well, we've received top ratings in polls by both Datquest™ and Reliability Ratings. And we've won virtually every major customer satisfaction poll we've participated in over the last five years.

So call Dell and get yourself a real node. Not just some PC masquerading as a node.

DELL NETPLEX.
PCs DESIGNED SPECIFICALLY
AS NETWORK NODES.

DEC readies storage array controller

By Craig Stedman
BOSTON, MASS.

Digital Equipment Corp.'s recent introduction of a new storage array controller for connecting Small Computer Systems Interface-2 peripheral devices to OpenVMS-based VAX and Alpha AXP clusters drew mostly favorable notices

from users for bringing DEC more up to date in the high-end storage market.

The HSJ40 is due to ship in late September along with six new StorageWorks subsystems. While the first version does not match the raw I/O throughput of DEC's earlier HSC controllers, the company said it costs much less, particularly for purchases of 50G bytes or more.

Customers have "perceived us as expensive when they wanted to add a lot of storage," acknowledged Bruce Baird, StorageWorks product manager/market manager. But the cost of a 760-I/O setup is \$2.05 per gigabyte with the HSJ40, down from \$4.75 per gigabyte using an HSC unit, he said.

Attention-grabber

The promised price break caught the eye of George Reid, MIS director at Sanford C. Bernstein & Co. in New York. He considered shifting to solid-state storage for some of his VAX-driven database applications but said the HSJ40 "could allow us to do it in a much more cost-effective manner."

The HSJ40's support for redundant arrays of inexpensive disks (RAID) technology and the modular approach DEC is taking with StorageWorks are appealing, Reid added.

"This is the kind of packaging DEC should have been doing the last 10 years and didn't," he said.

Reid said he expects to buy HSJ40-equipped subsystems later this year. Frank Brake, director of international operations for technology business development at Newport News Shipbuilding and Drydock Co. in Newport News, Va., said he also will likely purchase some over time.

However, PacificCare Health Systems, Inc. in Cypress, Calif., chose rival MTC's FallSafe RAID subsystems in a recent buy-

At the controls
Features of DEC's new HSJ40 storage array controller for OpenVMS clusters

Capacity

- Handles up to 16 SCSI-2 disk drives via six separate SCSI-2 bases.
- Maximum of 760G bytes, using DEC's 2.5G bytes, 3 1/2-in. drive.

Supports

- VAX and Alpha AXP clusters using DEC's CI interconnects.

Performance

- 1,000 I/O requests per second (2.05 per dual-redundant configurations).
- 4M bytes/sec. bandwidth per controller.

RAID capabilities

- RAID-0 and RAID-1 supported; RAID-3 and RAID-5 planned.

Planning and availability

- \$10,000; late September.

One shortcoming of StorageWorks is its lack of support for non-DEC disk drives, said Matt Holdrege, senior network specialist at PacificCare.

Baird said DEC's storage business unit plans to add support for third-party drives as part of its long-term StorageWorks strategy. However, he added that it has "not seen a timeline for accomplishing that."

The StorageWorks strategy appears sound, and DEC's pricing is "very competitive," said Dennis Ward, president of Peripheral Research Corp., a market research firm in Santa Barbara, Calif.

ReportSmith

As Serious As You Are About Reporting

ReportSmith is the client/server query and reporting product with all the power you need to build sophisticated reporting applications. And the ease of use you need to put reporting into the hands of your end users.

"ReportSmith produces stunning reports from your database files interactively, using a WYSIWYG approach to report formatting that makes designing a report a simple point-and-click experience." - PC Magazine

ReportSmith offers a unique visual layout approach for building columnar, form or cross-tab reports interactively on the screen with live data. And extensive formatting capability includes chart, fonts, color, and images.

If you know Windows, you know ReportSmith. Save time coming up to speed with ReportSmith's standard Windows user interface—and move ahead of the pack with OLE, DDE and ODBC.

A powerful cross-tab facility makes tasks such as standard financial reporting a snap. Point and click to define a complex report.

Customize or extend reporting applications and access DLLs with ReportServer, a Visual BASIC-like macro language. Seamlessly integrate with PowerBuilder, SQL Windows, Oracle, Visual Basic and other application building tools.

One product, one price. No need to buy different versions of ReportSmith for different databases.

Building a set of reports for wide distribution? Free runtime is included. "All for a rather amazing limited-time price of \$129 for your first copy."

Call Today 1-800-446-3446 ext. 300

REPORTSMITH

ReportSmith is COMpliant and runs native under Windows 3.1, Windows 95, OS/2 Version 3 and 4, DOS 5.0 and above, QNX, and Unix. ReportSmith is available in English, German, French, Spanish, Italian, Dutch, Portuguese, Chinese, and Japanese. ReportSmith is a registered trademark of Indigo Software Corporation. EMC Harmonix keeps on growin'

By Stephen P. Klett Jr.

Adding fuel to the debate over which storage method provides the best bang for the buck is the Application System/400 market, EMC Corp. in Marlboro, Mass., recently unveiled new additions to its Harmonix series of direct-access storage device products aimed at bringing AS/400 shops into the micropartition field.

EMC took the wraps off two new models—the entry-level HX300 and high availability HX300A—and expanded the cache capacity of its Harpoon HX model to 50GB hybrid (write cache) and 512MB bytes of read cache. The HX line offers 1.7G bytes of raw storage capacity, transaction speeds averaging 7 seconds to 10 msec., and board-level upgradability. Prices range from \$25,000 to \$73,000.

The Harmonix line is based on mirroring technology or redundant arrays of inexpensive disks (RAID-1).

Reliance on RAID

While mirroring offers the highest level of data protection, users have been reluctant to commit to it because of its high cost. RAID-1 is being pushed as a happy medium, giving users a similar level of data protection at a lower price, although at a slight performance trade-off.

EMC claims the HX300A's price point,

sitions it to compete directly against RAID-5 products such as IBM's 9537 storage subsystem. And users, including true-blue shops, appear to be listening.

For example, Chelsea Community Hospital, a longtime all-IBM customer in Chelsea, Mich., is beta testing the HX300A. While the system has only been installed for a few weeks, the 37-bed rural hospital plans to replace all of its IBM units with EMC equipment, according to Jim Davis, administrative director of information systems.

While Davis was impressed by the price/performance level of the HX300A,

he said it was EMC's service and support that was the primary differentiator.

"We can't get IBM to respond to us since it's had troubles," Davis said. "All the people we deal with in the area have been laid off." Davis acknowledged that Chelsea Community Hospital is a small customer site with two AS/400s and roughly 125 PCs and that IBM "is in a state of flux and it's easy for people to drop through the cracks."

EMC offers Harmonix customers a service option called the Remote Maintenance Program, which enables it to monitor the performance and threshold levels of customers' systems from its headquarters. Every EMC product can be configured with the service at prices starting at \$3,000 for up to eight ports.

LAN READY, SET, GO.

It can, shall we say, take a little, uh, extra time to, you know, get your typical PC on the, uh, network.

Well, Dell's new NetPlex™ systems are not typical PCs. They're true high-performance machines that are also network nodes through and through.

Designed to be up and running on your network in five minutes or less.

Just ask, and we'll

gladly take care of the more monotonous, time-consuming set-up chores for you. Like factory-installing network interface cards. Running NIC diagnostics. Installing your software. And setting jumpers.

We even made it easier to access your system set-up utilities — with a simple CTRL-ALT-ENTER. Rather than the yawn-inducing process of rebooting your system to load the system set-up from a diskette.

So give us a call to order your nodes. Or, uh, who knows, uh, what you may have to, uh, go through?

IBM services

CONTINUED FROM PAGE 71

IBM's services shift, announced internally to employees earlier this month, includes the creation of IBM Business Transformation Services, North America. The new unit represents an expansion of business process re-engineering services that had been offered by the IBM

Consulting Group, according to Sam Albert, an independent consultant in Scarsdale, N.Y.

Albert said the re-engineering unit is taking a "mass customization" approach with its customers or "crafting and customizing enterprise solutions for each individual customer," Albert said.

In the market

In addition, the IBM Consulting Group is planning to add banking, health care, in-

surance and other industry professionals to its ranks to provide customers with additional expertise in their specific markets, Albert said.

A spokesman for IBM would not directly confirm those reports but added, "IBM has been clear in the fact that we intend to expand our expertise in specific industries."

Other markets that the IBM Consulting Group caters to include telecommunications, retail, manufacturing, transporta-

tion and utilities. By forging closer ties with IBM's marketing arm, the consulting group should gain further knowledge of its clients' industries, analysts said.

Although the IBM Consulting Group now reports to IBM North America, the reporting structure has not changed for consultants working abroad. Consultants in Europe and Asia will continue to report to their regional units and will send "dotted-line" reports to the IBM Consulting Group in the U.S.

Computerworld brings you a dedicated resource to help you find the information you need quickly — Computerworld on CD.

With this valuable resource tool you can:

- Find product and vendor company information quickly.
- Stay on top of strategic industry directions.
- Follow critical technology trends.
- Analyze top company IS profiles and compete with yours.
- Execute key word searches on any topic within seconds.
- Eliminate paper storage.

Your subscription to Computerworld on CD includes:

- Over four years worth of full text articles from Computerworld.
- Selected graphics from each issue showing industry trends, product comparisons and more.
- Articles from Computerworld's

annual Premier 100 and Computer Careers magazine.

- Detailed information from the Premier 100 database — total score, profit growth, IS budget, company highlights and more.
- Plus a new bonus feature — over five years worth of articles from the Journal of Information Systems Education, published by DPMI EDGIC.

Save \$100 on charter subscription offer.

Become a charter subscriber for just \$395 and save \$100 off the regular annual price of \$395. This offer is available for a limited time only, so act now.

Your annual subscription includes four discs updated quarterly.

Briefs

Oracle tops Unix market

Oracle Corp. leads the Unix relational database market with 44% of 1992's \$2 billion in worldwide sales, according to market research firm International Data Corp. (IDC) in Framingham, Mass. Informix Software, Inc. was next in line with 15%, followed by Sybase, Inc. with 12% and The ARK Group, Inc.'s Ingres Products Division with 9%, IDC said.

Norwest buys NCR system
Norwest Bank Minneapolis, Minn., has purchased NCR Corp. image-based check processing systems for its wholesale locker processing operations in Minneapolis. Terms of the agreement were not disclosed.

VMark to port PI/Open

VMark Software, Inc. has agreed to port its PI/Open database management system to Digital Equipment Corp.'s Alpha AXP systems and the DEC OSF/1 operating system. DEC will make VMark's DBMS products available through DEC sales channels, the firms said.

ProSMS gets IBM support

Beale & Babbage, Inc. recently said its ProSMS suite of storage management products will be supported by IBM in terms of on-site services for implementing IBM's Data Facility Storage Management Subsystem (DFSMS) platform. The ProSMS products are tools designed for planning and performing DFSMS conversions and monitoring and controlling storage subsystems.

FOR THE PRICES LISTED ABOVE, WELL INSIDE THE CARD, RUN THE DIAGNOSTICS, AND EVEN SET THE JUMPSIES SO YOUR NODE IS READY TO GO.

God bless America. Where else could you find a PC maker that delivers your PC with your choice of six different factory-installed network interface cards? Each one factory-tested and validated for interoperability with the most popular NetWare® operating systems and topologies.

We're talking about Dell here, of course. Not one of those companies that offers you one take-it-or-leave-it proprietary card which may or may not be compatible with your network's wiring. A card which will, nonetheless, cost you as much or more than the cards Dell offers.

It's this level of attention to detail that makes Dell's NetPlex™ systems PCs that truly earn the right to be called nodes. They've

been designed from the ground up to work on your network. With great

care taken to see that you avoid the usual hassling and tweaking.

Call us to order your Dell NetPlex systems. You won't find an opportunity like this anywhere else.

Software

Ross Systems, Inc. has announced the Human Resource CS Series, a client/server-based system designed for complex human resources and payroll departments.

According to the company, the Human Resource CS Series provides split processing and supports a mixture of client programs. Optional capabilities include leave, check-pricing features, payroll tax filing, imaging and a 24-hour benefit hot line for employee inquiries.

The company also offers Macintosh, Motif and Windows implementations with the same native look and feel and application features for each graphical user interface.

User-based pricing for the series start at \$15,000 per module.

► **Ross Systems**
555 Turin Delphi Drive
Bedford Park, IL 60636
(708) 589-5500

McGraw Software, Inc. has announced Ultraimp/TMS, a product designed to improve response times and increase TMS message throughput by reducing the size of data streams and redirecting co-hosted message traffic.

According to the company, Ultraimp/TMS reduces the length of outbound data streams by 50% to 85% and inbound streams by 40% to 90%. TMS throughput can be increased by up to 20% by redirecting message traffic from an overloaded Task Control Block to Service Request Blocks, the company said.

The product works transparently to

the user and does not require any modifications to VTAM or other system components.

The need to install an optimization product for each IMS subsystem is eliminated because Ultraimp/TMS installs once per CPU and works for all IMS control regions at the same time, the company says.

A perpetual license of Ultraimp/TMS costs \$46,000.

► **BMC Software**
1 Sugar Creek Center Blvd.
Sugar Land, Texas 77487
(713) 240-5800

BlueLine Software, Inc. has added support for Novell's NetWare HostPrint to its MultiPrint/VM print routing software.

MultiPrint/VM was designed to permit organizations using the IBM VM operating system to print mainframe output on local-area network printers without adding hardware or software.

The company said the product can access any printer enterprise-wide with support for HostPrint running under NetWare for SAA. Printing options now include Epson America, Inc.'s dot-matrix printers, Hewlett-Packard's LaserJet printers, ASCII printers and other LAN-compatible hardware.

A permanent license for MultiPrint/VM ranges from \$7,500 to \$14,250.

► **BlueLine Software**

6775 Wayzata Blvd.
Minneapolis, Minn. 55416
(612) 542-1072

Hardware

XL/Datocomp, Inc. has introduced the Nearline ACS 9700 ½-in. square tape

Automated Cartridge System.

The product works in conjunction with the company's Nearline DMS Data Management Software and Nearline LCU 5701 Library Control Unit, which make up XL/Datocomp's Nearline ½-in. tape library system.

The ACS 9700 stores up to 86G bytes of uncompresses or 256G bytes of compressed data on a maximum of 298 extended-length, ½-in. tape cartridges, the company said.

An automated robotic device, a rotational eight-sided carousel with three magazines per side and a bar-code reader are included.

Pricing for the Nearline ½-in. tape library system starts at \$10,825.

► **XL/Datocomp**
568 North Elm St.
Hinsdale, IL 60521
(708) 323-1200

Computer Power, Inc. has announced the Computerware Mark II Uninterruptible Power System.

The product offers a Novell, Inc.-approved file server interface and includes features such as complete power line conditioning, 92% efficiency, 150% overload capacity and a two-year electronics warranty.

RS-232 communications power, extended runtimes of up to eight hours and rack-mount configurations are options. Capacities range from 900VA to 19kVA, the company said.

Prices begin at \$1,600.

► **Computer Power**
124 W. Main St.
High Bridge, N.J. 08829
(908) 638-0000

Acknowledge, Inc. has announced a tape backup option for its Alice family of

on-line direct attach optical storage products.

According to the company, the Optical Backup Solution uses either a single or dual high-density helical scan drive embedded in the optical controller. Each cartridge can house at least 160 bytes with improved data recording capabilities data compression.

Users can back up one optical platter or a complete optical library. Because it is performed off-line, backing up a 20G-byte cartridge with rewritable media takes one-tenth the time of going through IBM's Application System/400, the company said.

Support for off-line tape operations for IBM 3995 libraries is provided.

A single-drive, 100-byte unit costs \$12,750. A dual-drive 20G-byte drive costs \$12,750.

► **Acknowledge**
251 West Central St.
Natick, Mass. 01760

It's all time high, wiping out more than \$1 billion in shareholder value.
'Sleep Learning Curve'

These pressures have little time for a new boss to master IBM's business. Only 52% of IBM customers surveyed by Computerworld magazine say IBM needs to hire a CEO with a technology background. With Mr. Gerstner leaving such a pedigree, "he's going to be on a very steep learning curve," says David Isaacs, a former IBM executive who is now president of Isaacs Group, a computer-consulting

THE WALL STREET JOURNAL.
March 25th, 1993

IV. Computer & Automation

"Information systems managers are grasping rate line as a 'Holy Grail,'" said Paul Galle, executive editor of *Computerworld*, which is just one of many industry trade publications that spotlight computing on a regular basis. "It is an important key for competition."

The large cloud summit convenes in May, when a new book by management consultants Michael Hammer and James Champy will be titled "Reengineering for Revolution."

Investor's Business Daily
March 25th, 1993

—
—

HERE, THERE'S A MOUSE in the corner office. The percentage of executives who regularly see competitors nearly doubled in four years, from 47% in 1986, says a study by Compensation Research and Advances Consulting. Fewer than half think they are getting their money's worth from corporate computer systems.

THE WALL STREET JOURNAL
April 20th, 1993

**Their question:
Where are the
productivity
savings?**

The New York Times
April 25th, 1993

CORPORATE executives appear to be more knowledgeable about computer technology than ever before, but they have also become more demanding and less forgiving, a new survey has found. While they believe information technologies are the key to competitive advantage, they also say that they have been getting their money's worth.

The survey, conducted by the computer industry newspaper, Computerworld and Andersen Consulting, also found that 81 percent of top executives are personally using computers in their daily jobs, nearly double the percentage reported when the survey was first taken four years ago.

More than 200 chief executives, chief operating officers, and chief financial officers, representing a broad range of businesses, participated in the study, the results of which were published in *Competitiveness* last week. Annual company sales ranged from \$250 million to \$20 billion.

**OUR CUSTOMERS
HAVE THEIR SAY TOO**

IBM directors should forget about hiring another salaried man to replace John Akers as CEO. And whoever he is, Akers' successor should fire a whole lot more people. So says a Computerworld survey of executives at 100 companies that spend at least half their computer budgets on IBM products. The participants, who work at the likes of Kaiser and Parker Hannifin, a maker of pneumatic and hydraulic components, also said IBM's reorganization into smaller business units should go further. Computerworld, in addition

interviewed various computer industry luminaries, including Steve Jobs. The Next CEO marveled that none of IBM's machines from mainframes to PCs uses the same software. Says Jobs: "IBM's troubles stem from the fact that they approach everything from a hardware strategy, and the Nineties is a software decade."

Not everybody agreed that breaking up is the way for IBM to go. Said Larry Ellison, CEO and co-founder of Oracle, a software company: "This is the

Taking a byte out of crime PowerBuilder 3.0 gets the nod

Phoenix police use CASE, other tools to speed work

By Thomas Hoffman

PHOENIX

The City of Phoenix Police Department needed a break in its pursuit of the elusive Yogurt Bandit, an unidentified suspect who had linked to 15 robberies of yogurt shops, convenience stores and banks over a three-month period in 1990.

Some savvy detective work and helpful automation gave them that break and led to an arrest. Using a field interrogation (FI) database, a Phoenix detective matched the description of a person seen in the area with a description of the Yogurt Bandit. The vehicle license plate of the suspect matched a partial plate number that witnesses had given police.

After searching through apartment complex parking lots in the identified area, the detective found a car that nearly matched the witnesses' descriptions. Police stalked out the parking lot until the culprit walked into their trap.

Fast-paced tracking

The detective who tracked down the Yogurt Bandit used a system called PAGE, or Police Automated Computer Entry, which was developed using Unisys Corp.'s ICL II computer-aided software engineering software. It includes the FI subsystem, a database that stores data from the reports patrol officers file when they question someone who is acting suspiciously but is not arrested.

The PAGE system has provided the police department with benefits beyond those seen by the detectives. For example, reports were once handwritten by the department's 2,100 officers

The city in the desert could see a 20% rise in police reports by 1997, which Michael Barry will help the Phoenix Police Department handle with computers

and usually took 45 minutes to complete. Now officers telephone information to data entry clerks who enter the information on Unisys CTOS workstations and complete the reports within 20 minutes. Moreover, the PAGE application, powered by a Unisys A15 mainframe, prompts the data entry clerk to ask the reporting officer for additional information if needed.

The system, developed during an 18-month Byte, page 62

BURLINGTON, MASS.

Beta-test users and consultants familiar with Version 3.0 of PowerSoft Corp.'s PowerBuilder, which is slated to ship next month, gave the new release high marks in comparison with Version 2.0.

However, they cited concerns about the ability of this and comparable products to help develop complex, compute-intensive and mission-critical on-line transaction processor applications in client/server environments.

Version 3.0 contains a range of new features, some of which the company says will strengthen users' ability to develop such large-scale applications. These include repository enhancements to allow developers to define graphic behavior associated with data and performance improvements.

Other features

Links to other products, such as Interbase, Inc.'s PVCS, will help users to centrally manage applications. Open application programming interfaces to PowerBuilder libraries have allowed computer-aided software engineering tool vendors such as Bachman Information Systems, Inc. to connect to PowerBuilder.

Configurable tool bars and shared result sets across multiple DataWindows, as well as drop-down data windows, smooth the development process, PowerSoft officials said. This release will also offer support for the Watson International Corp. SQL database for

building stand-alone applications or for working with server-based applications while detached from the network, they said.

Improvements to reporting capabilities include business graphics, cross-tabs and labels and an object query painter, which lets users visually create database query objects that offer business views of database information.

Byte out of crime

CONTINUED FROM PAGE 51

period and fully operational since April 1991, is expected to help the Phoenix police tackle the city's steady growth in crime. Mike Barry, assistant administrator of the department's computer services bureau, said the department anticipates a 20% rise in police reports over the next four years, based on studies of crime growth trends of the past 20 years.

"Using

PACE, our officers can file reports faster and spend more time in the field where they're needed," Barry said.

Once data entry clerks finish a report, they send it electronically to the appropriate bureaus, such as homicide; it is simultaneously reviewed by the reporting officer. The reports are stored on a case management subsystem that compiles supplements to the original case such as laboratory reports and letters to insurance companies.

Before PACE, the department relied on the manual delivery of color-coded, paper-based police reports to different divisions, which often took three days or more for detectives to review the reports on their cases. With PACE, detectives receive the reports as soon as they have been completed.

PACE will be supported by other planned systems upgrades and additions. The police department is in the middle of replacing an aging minicomputer-based computer-aided dispatch/mobile data terminals (CAD/MDT) system with a network of 150 Intel Corp. 386/387 and 486-based PCs. The PCs will be connected to three Hewlett-Packard Co. HP

3000 minicomputers via host-to-terminal links.

The new CAD/MDT system cost the department \$8.2 million and is scheduled for full operation in January 1994. It will route calls for patrol officers and will eventually send detailed information to police cars equipped with Motorola, Inc. 9100-386 mobile data terminals.

The Motorola terminals are expected to provide patrol officers with critical information about any crimes in progress

that they are assigned to while alleviating the work load of the department's radio dispatchers. Since most of the department's patrol cars are staffed by just one officer, the mobile data terminals will act, to some degree, as their terminals.

For example, with the Motorola terminals, officers will receive a detailed sketch about a convenience store robbery in progress, including whether the assailant has a gun and a physical description of the premises. The data terminals will be installed in 675 patrol vehicles and some unmarked cars beginning in mid-January.

The CAD/MDT system will eventually feed into geographic information systems (GIS) being developed by the city of Phoenix, which is using GIS tools from Environmental Systems Research Institute, Inc. in Redlands, Calif., to construct GIS applications [CW, June 14]. Tying into the GIS systems with their Motorola mobile terminals, officers eventually will

be able to receive detailed information about building plans and situations such as hazardous materials at emergency scenes.

Use of GIS is on the rise at other police departments — San Diego and Baltimore, for instance — and has enhanced their crime-solving capabilities, said William L. Gorr, a professor of public policy and MIS at the Heinz School of Public Policy and Management at Carnegie Mellon University in Pittsburgh.

PowerBuilder

CONTINUED FROM PAGE 81

In addition, Powersoft will ship two scalable products on the low end — Power-Maker and PowerViewer. Features include the ability for end users to access data and create queries and reports.

Users and consultants praised the new capabilities.

"There are a lot of advanced features with 3.0 that just aren't available with 2.0, so we've been using the new version to convert our Prime malformation applications," said Joe Horeeney, a project leader at Chrysler Systems Inc., a subsidiary of Chrysler Corp. in Oakbrook, Ill., and a beta-test user of 3.0. Horeeney said tool bar objects and improved reporting facilities were particularly helpful to his group.

The new release is a big step from the current version, according to Donald de

Palma, an analyst at Forrester Research, Inc. The data connections are better than they were, he said, and the Wincom database allows for local prototyping before deploying algorithms out to Sybase, Inc. or Oracle Corp. databases.

Also, the ability to link to third-party components strengthens PowerBuilder by making it "more of a pegboard" as opposed to a discrete, proprietary tool.

What about the high end?

But de Palma and others raised questions about the ability of PowerBuilder to handle high-end, transaction-intensive applications, since the feasibility of tools like PowerBuilder and Gupta Corp.'s SQL Windows for that kind of development is as yet unproven. Powersoft is addressing some of those issues, but client/server development has so far been in "too-dipping, single-department mode," de Palma said.

Fourth-generation language vendors such as Progress Software Corp. and Cognos Corp. are beginning to target client/server development, and they have the advantage of years of experience with large-scale applications. The current crop of Windows-based tools have not had as long to mature, de Palma said.

While this version improves on earlier releases of PowerBuilder, said Terrence Oi, a manager at KPMG Peat Marwick in Boston, the product has been a bit slow for applications with a strong data entry and transaction processing focus, particularly when compared with traditional mainframe CICS applications.

But at Standard Commercial Tobacco Corp., the five or so users of one data entry application, who handle about 40,000 transactions per day, have found PowerBuilder's performance to be sufficient, said Randy Rabbin, a programmer.

On the low end, Windows-based tool makers contend with Microsoft Corp.'s Visual Basic. "Visual Basic is every tool vendor's nightmare and threatens to become the universal programmer's Swiss Army knife of the '90s — nearly every site is equipping developers with Visual Basic as one tool they will use," de Palma said.

The Integration Company

Management

► Illinois Power's Max Burgstahler: People's minds are just starting to click about the need for SQL connectivity.

POWER TO THE PEOPLE?

SURE, GROUPWARE IS GREAT. BUT THE ELECTRIFYING GROWTH OF NOTES AND OTHER PRODUCTS POSES HUGE NEW INTEGRATION HASSLES. HERE'S HELP.

A groupware projects within organizations proliferate, information systems directors face mounting challenges that require the diplomatic skills of an ambassador and the technical savvy of a helicopter mechanic. Groupware applications in individual business units have multiplied like rabbits. Unfortunately, that has left IS directors faced with scores of applications that must be integrated with organizations' overall system resources.

At Illinois Power Co. in Decatur, Ill., for example, SQL connectivity has captured the imagination of the utility's personnel. The utility plans to build an application linking a Notes database for engineers with a SQL database containing engineering parts numbers.

"People's minds are just starting to click [about the need for SQL connectivity]. They see it as something with real potential," says Max

Groupware, page 88

Groupware

CONTINUED FROM PAGE 88

Burgstahler, Illinois Power's information technology supervisor.

"Integrating Notes with SQL databases is the biggest problem we have," says Kevin Denehy, senior business analyst at Millipore Corp., a filtration equipment manufacturer in Bedford, Mass. "There's a lot of data that the sales force has using Notes that needs to be analyzed."

In addition, Denehy says, salespeople must be able to attach a query to an electronic-mail message that would then access a customer list on a SQL database to provide a profile of that customer.

To solve this problem, Millipore is beta-testing a custom-built product, called DataMover, that will link a SQL database to Notes using Dynamic Link Libraries. Denehy says, allowing Notes users to run queries as background tasks.

Getting a jump

However, Millipore is way ahead of its IS brethren in terms of integrating Notes with SQL databases, with most IS directors just beginning to consider the implications of integrating two completely diverse environments.

"Sooner or later, we're going to need to feed all this [groupware] data into the existing mission-critical applications," says Jeff Held, a partner in the technical services practice of Ernst & Young in Vienna, Va.

Unfortunately, integrating a host of sundry applications poses a problem. Many IS personnel simply don't possess the language skills required to manage diverse groups or departments that have created groupware applications using PC application development tools.

So one of the first orders of business for IS directors — who tend to be schooled in Cobol language and SQL databases — is to become fluent in a PC world dominated by macros and @Com-

mmands working directly against documents and forms.

"Groupware is such a different beast for information technology than it is for speaking a completely different language for which they have no common base to understand," Held says.

Because of these issues, IS per-

forms working directly against documents and forms.

"Groupware is such a different beast for information technology than it is for speaking a completely different language for which they have no common base to understand," Held says.

Although groupware application development is likely to be the province of individual departments, the coordination of the activities of these departments will require the orchestration of an IS director who can set up hierarchical naming services and enforce standards and practices.

"Groupware is a technology that can easily get out of control and turn into a real nightmare. Ideally, you want to bring IS in early because most organizations will go crazy when they first get started," Zabors says.

"You need to involve people who know both IS and groupware systems. With groupware, you can fall down a hole and find yourself getting to hell in a handbasket in a hurry," Weiser adds.

Without IS support, in fact, customers will find themselves with an implementation that's either poorly used or not used at all, he adds. Some IS staffers are at odds with some users because of a fear stemming from the loss of control implied by groupware.

"If people need to change how they think, they tend to think in terms of outer joins, rows and columns. End users live in a world of documents," Held says. "Ideally, you would want IS people to be out ahead of the users, but we've found that IS people just don't get it, and the reaction is pretty negative."

Aggressive adopters

But several IS shops have adopted proactive stances toward groupware applications. Bankers Trust Co., for example, has completely reorganized its IS department by pushing responsibility for application development down into the individual business units, with IS maintaining the company's overall IS infrastructure.

Held argues that the Bankers Trust model essentially blesses the existing state of affairs within most organizations today.

"Every department has its database application or some other set of applications that has been covertly created that IS has no idea about," Held says. In fact, he adds, moving responsibility for application development down into

sonnel might change the way they think about computing, especially within the realm of application development.

Groupware has taken the same path as local-area networks in that it has come out of the field. The problem is that the people in the glass house are discovering to their horror that these applications can now affect their corporate data and they have no control over them," Held adds.

Moreover, because IS personnel tend to be focused on procedural languages such as Cobol and C, they tend to be poor programmers in groupware environments that tend to be based on PC programming techniques running against applications based on a document metaphor.

"If I have two people with equal pay, and one is a Cobol programmer and the other is a spreadsheet programmer, I'll take the spreadsheet programmer every time," says Norman Weiser, president of Weiser Associates, Inc., a consultancy in Lexington, Mass.

"The best candidates are business operations people with technical backgrounds who can look at

GET READY FOR CULTURE CLASHES

Though groupware's cultural impact on an IS organization is at first likely to be a pivotal concern for the IS director, the real challenge to an IS chief's management skills will come from his or her dealings with individual departments.

Once an IS department decides to evaluate the adoption of groupware within the organization, there are a number of political and psychological hurdles that they are likely to encounter among users.

"Technologists tend to be blind to certain business issues," says Bob Halperin, executive director for organizational sciences at MIT.

Salespeople, for example, are likely to be the most resistant to a groupware application, Halperin says, because most salespeople view its worth as directly tied to the number of sales contacts they have.

Salespeople tend to view sales leads as their domain, and they take them from company to company as they switch jobs. They may not want to put that information into a shared database," he says.

At the same time, IS people must apply their systems-analysis skills to groupware, especially when automating what was an inefficient paper-based process.

"When you automate a bad process, what you get is a fast, bad process that's widely distributed," says John Dwyer, a systems engineer at Corporate Software, Inc., a reseller in Canyon, Mass.

In addition to psychological issues, IS directors are likely to encounter middle managers who may feel threatened by groupware.

Fear of technology

At Illinois Power in Decatur, Ill., for example, information technology supervisor Max Burgstahler ran into some managers who resisted the flattened organizational structure that groupware promotes by giving all members of the organization access to shared data.

"It can be threatening to anyone who doesn't see themselves in a flattened organization. Fortunately, we have a pretty strong empowerment culture that is committed to increasing communications throughout the chain of command," Burgstahler says.

"It's a cultural issue, but people are becoming a lot more open these days," adds Paul Dunton, director of technology planning at Pacific Gas & Electric in San Francisco.

Finally, IS must assume the role of educator.

"A lot of times we'll hear from IS people that their executives simply won't use products like Notes," says Randal Zabors, president of Workgroup Productivity in Oak Brook, Ill.

To address this, Halperin says IS must get closer to the business units so those units can witness for themselves the real payoff from technology.

— Michael Flaxard

Source: Diane & Associates, Inc., White Plains

Randal Zabors sees an aversion to groupware products

individual business units is the only winning strategy available to IS shops.

"When you have a centralized IS, it's always going to be hit by more demand than it can service. So as far as somebody is concerned, IS is always going to make a wrong decision. If you move application development down to the business units, it's their responsibility to fund development," Held says.

Another road traveled

Some organizations have opted to bring the expertise of the business units into the central IS organization. Such was the strategy used by Johnson & Higgins, a New York insurance carrier that brought William Wilson III from a field office into its IS shop as a company vice president.

Taking a more middle-of-the-road strategy is Pacific Gas & Electric Co. (PG&E) in San Francisco. The IS shop provides departments with a series of standard Notes applications that can be deployed alongside any custom Notes applications that are developed by departments. To do this, PG&E has set up a specific task force within its IS organization that is dedicated to office computing.

"About 10 years ago we saw that it would be futile to resist PC technology. So we set up a group within IS that would be enthusiastic about it and create a manageable environment," says Paul Dunton, director of technology planning at PG&E.

The IS group at PG&E will evaluate the quality of any Notes application that might be distributed across different departments, where 40 servers now support 1,700 users.

"Typically, we show them why a particular application might not have the performance they are looking for across a WAN," Dunton says.

But organizations such as PG&E and Bankers Trust tend to be the exception, not the rule. Persuading IS shops to facilitate groupware applications, not fight them, represents one of the great cultural roadblocks to the adoption of groupware. "A lot of IS people are going to go into this kicking and screaming," says Susanna Oppen, president of Oppen & Associates, Inc. in Alford, Mass.

After all, she says, groupware applications require IS people to navigate a large number of social, political and business issues for which they are poorly prepared. "We no longer live in a bifurcated world where there are separate business and consumer areas. Groupware is the way business will be done," Oppen says.

In addition to the social issues involved, IS people tend to look askance at groupware because of their technical training.

Specifically, groupware applications tend to de-emphasize security, testing and standardization issues in favor of solving an immediate business problem across what many IS people consider to be unstable networks.

"The programmers and working-level people at IS shops tend to get very nervous. They find it totally confusing because a lot of the concepts they have learned simply don't apply," Weizer says.

"IS people tend to look at groupware

AN ACTION-PACED SQL LIVING DATABASES

One of the biggest challenges currently facing IS directors who have already opted to deploy Notes packages in the installation of this growing software are offering viable SQL database services.

"Notes is still relatively young, but the need for this integration is going to become apparent over the next couple of months," says Norman Weizen, president of Weizen Associates, a consulting firm in Lexington, Mass.

But pulling that integration off is likely to provide a significant challenge to IS personnel.

"The texture of the data is quite different. SQL databases are rows and columns, while Notes is a text-oriented environment with lots of dimensions and graphics," notes Max Burstinberg, supervisor for information technology at Illinois Power in Decatur, Ill.

Despite these differences, the integration of the two environments is still a worthwhile project. Since an individual Notes database is only 1G byte in

size, developers have begun working on Notes applications that will take advantage of a SQL server facility in Notes to access Notes on much larger SQL databases.

For example, a Notes user will be able to look up...

a mail list kept on a SQL database in order to find which users should participate in a particular Notes discussion. To facilitate such applications, Lois is working on providing a series of DataLink drivers for Notes Version 2. Those drivers, however, are still undergoing beta testing.

In the meantime, some Notes sites have been working with a Data Pump tool from Triad Corp. in Pleasanton, N.H., which provides a tool that allows data to be exchanged between Notes and a SQL database in batch mode.

In addition to the Data Pump, some of the more adventurous Notes sites have worked with the Notes application programming interface (API),

which is written in C language, to link Notes to SQL databases.

Lotus Development Corp. is also currently working with a variety of SQL database tool vendors to support Notes with their applications development tools, according to Notes product manager John Bartlett.

This work should eventually allow a Notes user to update a SQL database.

"Linking SQL application development tools with Notes is a natural. There's a synergy because there is a lot of structured and unstructured data in Notes," adds Steven Chalatyan, president of Chalatyan Consulting, Inc. in Oakland, Calif.

However, working with the Notes API is not for the faint of heart. "I tend to stay away from the Notes API; it's not easy to use," says John Dwyer, a systems engineer at Corporate Software, Inc., a reseller in Canton, Mass.

How to pass the bar exam.

Scan this bar code with your eye.
Notice how clearly defined its
characters are. A scanner will find
no trouble in this bar.

An impressive lineup. Our toners
perform in extreme temperatures.
Nice to know when your printer's
on-line for hours on end.

Our high-quality toners
virtually eliminate "bridging"
between scan lines.

These days, there's a code we all must live by. The bar code. And as common as the bar code is, it is the very devil to render properly. One tiny error, and a spool of thread becomes an entire suit.

Lexmark strives to surpass the precision that is expected of our IBM[®] toners. The IBM toners that many industries rely upon for crisp bar codes can make your printing look sharp, too. Insist on original IBM toners by Lexmark. You'll be using the best, bar none.

To locate the dealer nearest you, to order, or to receive your free catalog, call 1-800-438-2468, ext. 50. (In Canada, call 1-800-663-7662.)

Lexmark International, a former subsidiary of IBM, is an independent, worldwide company that develops, manufactures, and markets IBM personal printers, IBM typewriters, related supplies and keyboards.

In Depth

The convergence of TV and computers . . .

HOW [REDACTED] WORKS

It's pretty much been that machines have known their place. Users go to their computers to power up their word processing program, do a little spreadsheet work, stuff like that. For entertainment, they turn to the television, maybe watch a little Letterman and hope to catch his latest Top 10 list.

Faster than you can say "Star Trek runs," however, things are changing. There's a shift happening that is blurring the lines between computer and consumer.

er technologies. The same TV through which you can tune in to CNN will be able to deliver an on-line newspaper or let you order a pizza.

Best of all, this convergence of technologies — computers, TVs, cable, telephones — is creating job opportunities for "information systems like nothing you've seen in a long time (see story below).

Brave new world

The killer apps in this brave new world are known collectively as "interactive multimedia," computer-based applica-

Convergence, page 90

... creates new job opportunities for IS

WHAT it MEANS

The convergence of consumer and computer technology means great opportunity for computer professionals, as well as for a new breed of managers to work with them.

This burgeoning area will require a slew of software developers, hardware designers, systems analysts, network administrators, digital audiovisual specialists, database administrators, communications gurus and other professionals to build the infrastructure that brings multimedia productions to market.

Creative people are needed to put together the interactive products and services that people will use.

Currently, there are as many as 100,000 people working full-time in the multimedia field, says Doug Millison, editor of *Morphe's Outpost on the Digital Frontier*, a new magazine for multimedia professionals.

Certain industries have rushed headlong into hiring multimedia specialists. Publishing companies such as Time Warner, Inc., The Walt Disney Co. and Paramount Communications, Inc. are "gearing up for the information highway in a big way" as they prepare for a populace that will quickly demand new forms of entertainment, according to Marc Canter, head of San Francisco-based Canter Technology, which is working on interactive television and multimedia applications.

Job opportunities, page 90

Consumer and computer technology is coming together to produce a "communicopia" of interactive TV and multimedia applications.

This merger is also creating a

demand for the IS "techno-artist" — a person with the development and artistic skills to bring these applications alive.

By David Baum

In Depth: Calling all 'techno-artists'

Convergence

CONTINUED FROM PAGE 89

tions that combine text, graphics, video, audio and animation into a media experience for users.

Interactive computer technology will give formerly passive viewers (or users, if you will) the terms are becoming interactive) almost total control over what they see, where they see it and what they do with it, predicts George Gilder, author of the book *Life After Television*.

Interactive TV is finding its way into numerous business applications. Today's retail giants, for instance, are eyeing the approximately \$70 billion that U.S. consumers spend on catalog shopping each year. What if that service could be made even easier? Toys R Us, Inc. is creating a private TV network and experimenting with video compression technology to sell products via an on-line, on-demand shopping network.

Meanwhile, the New Jersey Department of Education is creating an interactive TV system where students use remote control to respond to a lesson, and results are

automatically tabulated for the instructor's immediate review.

Health care companies such as Blue Cross/Blue Shield of Massachusetts are investigating the concept of "desktop surgery," a kind of a house call with a high-tech twist. Interactive TV would enable patients to contact practitioners through video, getting medical advice on the fly, says Martin V. Joyce, executive vice president of the client services group at the Boston-based company.

Branching out

For its part, the entertainment industry will take on elements of competing that until now have been available, is a rudimentary fashion, on-line or advanced works.

While watching a nature show, for instance, a viewer could pop up a map of an animal's habitat or select more data from a list of facts.

Video-on-demand would let a viewer use his remote control to scan a menu of titles on the TV, searching and selecting movies.

It's an ambitious vision of picking-and-choosing. With the market expected to reach \$3.5 trillion world-

wide by 2001, according to John Seelye, Apple Computer, Inc. chairman, it's no wonder some heavyweight companies in the computer (Apple, IBM), cable (Tele-Communications, Inc.) and entertainment industries (Time Warner, Inc., Paramount Communications, Inc.) are aggressively involved.

Vital moves

What will make this grand vision of interactive communications possible? These technical advances are vital:

• The ability to translate all audio and video communications into digital format. A variety of computer and electronics companies are

hard at work on this area. The list includes Apple, IBM and Custer Technology, a San Francisco company that offers of interactive TV and multimedia applications.

The work, which is reminiscent of assembly programming, may be the "easiest" part; what will be daunting is the effort to digitize existing information resources, such as art archives.

• The ability to transmit digital signals over high-bandwidth fiber-optic lines or via ultrahigh-frequency wireless. This new digital highway will, in the words of John Segall, GTE Corp. vice chairman, "be the world to gether in a bush of photons." Al-

most every large telecommunications and cable company is working on it, including GTE in Stamford, Conn., BellSouth Corp. in Atlanta, Tele-Communications in Englewood, Colo., and Time Warner in New York.

However, Corning, Inc., which makes optical fiber, predicts that rewiring networks and substations will take until 2007.

• New compression and storage methods. Companies are furiously at work on digital storage for complex multimedia objects on special computers called video servers, from which they can be dialed out on demand to TV users.

Right now, storing data digitally is a crushing demand, too much for today's disk drive to handle. Help may come in the form of CD-ROM enhancements, in which double-speed, quadruple-density CD-ROMs will provide the bandwidth to carry two hours of good quality audio and video objects on compact disc, according to Walt KlapPERT, head of technology at Warner New Media, the interactive multimedia subsidiary of Time Warner.

Others envision a home cable box or chips built directly into TVs that will enable digital functionality for interactive TV. Massive amounts of data will be sent down a fiber-optic wire or via satellite transmission, with chips in the home to decode, interpret and replay the data at speeds greater than 100 million instructions per second.

Education

CONTINUING
EDUCATION IN
MULTIMEDIA:

■ SAN FRANCISCO STATE UNIVERSITY (415) 338-1111 Comprehensive, including multimedia authoring on the Macintosh and PC, interactive 3-D graphics, digital video production, graphic arts, advertising, multimedia business management and interactive cinema.

■ CALIFORNIA STATE UNIVERSITY, Hayward (510) 881-3000

■ NEW YORK UNIVERSITY (212) 998-1212

The sky's the limit for tomorrow's technology

Hewlett-Packard Co. is one of the players in interactive TV, as producer of entrepreneurs-based "tools" that send and receive information to enable users in order plans, check a bank balance and so on from their homes.

Level Platé, president and chief executive officer of HP, recently discussed where the industry is heading with free-lance writer Joe Pappalardo.

"We see a future where computing is pervasive, where computing, communications, consumer electronics and, eventually, education and entertainment come together."

"By the end of the decade, you will be able to have any information you want or communicate with anyone you want to, anywhere, anytime. For example,

"You won't have to read through articles and reports because you might need the information at a later point. When you require data on a topic, you will simply ask your informa-

HP's Lew Platé: 'We see a future where computing is pervasive.'

tion tools to find it and sort it for you."

"You will talk to experts 'face to face' through your television to receive advice on anything from remodeling your bathroom to treating a bee sting."

"Your children's education will benefit. For example, when your daughter prepares a report on American history, she will download a document from the Library of Congress on to her home PC."

"People will be free of time and location constraints."

Creates new jobs

CONTINUED FROM PAGE 89

"All the word processing machines and spreadsheet machines have been bought," Carter says.

He points out that growth in the productivity software area, for one, is sluggish, consisting of upgrades by the same 5% of users. "If you want to go hit the other 95% of the world," Carter explains, "you'd better figure out how to integrate with television, with entertainment markets, with intelligent devices and services of all types."

Rise of techno-artist

The challenge, in Carter's view, is not building the enabling technologies — the wiring, the new TVs, the super-density compact disc drives — but producing the snazzy interactive productions that people will tune in to once these capabilities have been put in place.

Carter, who is not only a businessman and software developer but also an opera singer and computer graphics creator, says he envisions the emergence of a "techno-artist," the equivalent of a film director. This person would be able to combine the talents of a storyteller, musical director and software developer with the management experience to direct large multimedia projects.

Milsson agrees. "It takes an individual with a broad understanding of both the technical and artistic sides to create entertaining multimedia productions." Milsson says such an information systems person might have a graphic design background or may have done a stint in film school.

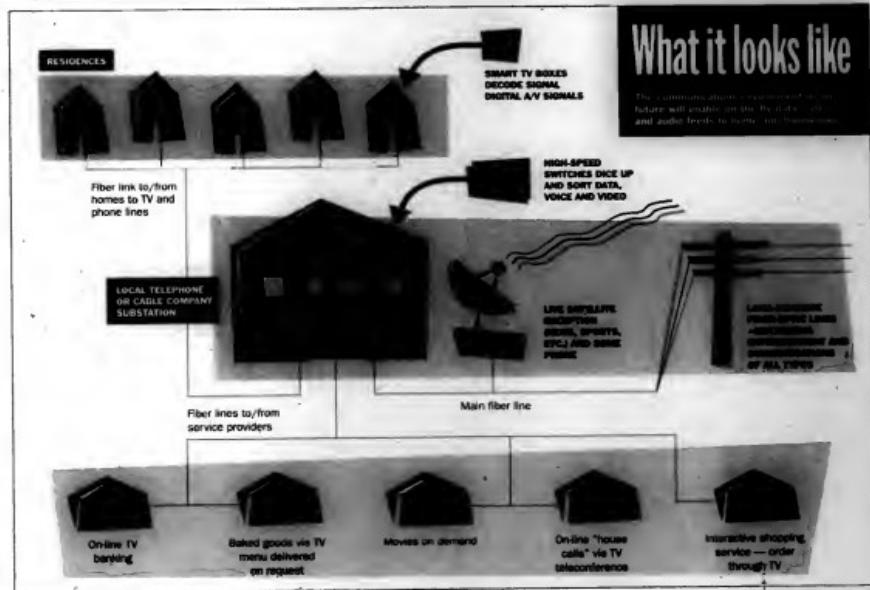

Such skills will open doors to new types of work. For example, to help sell vacation homes, one Los Angeles real estate company recently hired an advertising agency whose 18 people had to devise a multimedia kiosk application that would enable users to "walk" around the grounds of the new development, viewing houses from various angles and even browsing from room to room in the new homes.

Users can hear voice-overs on everything from construction elements to the specifications on kitchen appliances and hear the sound of waves crashing as they look out windows to take in the ocean view.

"Personality tests need to classify [ES types] as extremely rigid, meticulous, follow-the-directions people," says Billy Brackenridge, a programmer/engineer at Echo Speech Corp. in Carpinteria, Calif., who designs chips and algorithms for sound cards to use in Apple Computer, Inc. PCs. "But that is no longer the case. The new breed of [ES people] are not just techies but liberal artists."

At Echo Speech, for example, an understanding of music is essential to the creative process. In fact, the job requirements for our recent pro-

In Depth: Calling all 'techno-artists'

gramming position included being able to play a musical instrument.

"There will always be a need for hardware designers and software engineers," Millison says. "But these careers will begin to blend with the creative disciplines as technology changes and evolves."

The topics in Millison's own publication reflect this blend of the practical and the creative. Among some of the articles in the premier issue are "Building multimedia databases" and "Designing instructional ISDN," but also "Making money as a title brewer."

The one to watch

One technology evolution to watch is in old software languages, which are changing to handle the requirements of this new field. The foundation of multimedia development is today's new authoring systems, which help IS structure the interactive multimedia experience along a time line or through iconographic representation.

Authoring tools are generally based on object-oriented scripting languages, such as Script X from Kaleida, a joint venture between IBM and Apple.

Another Apple authoring tool, Apple Personal Intelligent Electronics (PIE), includes a media kit for technocreative people and a programming environment for software developers.

A "nontechnical" creative director at an advertising agency, for instance, could use the media kit to create a rough prototype of an application. Apple PIE then generates the scripting code, which is tailored by a skilled software developer to create a slick-running program. Other tools of this type are popping up for Windows and Unix platforms.

"If you want to get in at the core of this, you'd best be learning C and moving quickly on to C++," Canter advises. "The glue that binds it all together is object-oriented technology, with its ability to treat abstract entities like real-world objects."

Multimedia professionals will also have a much more interesting array of interface technologies to work with: voice recognition, holo-graphic interaction with three-dimensional characters and virtual reality interfaces.

"The switch from static, character cell screens to graphical, event-driven environments is just a shadow of what user interface programming will soon entail," Millison predicts.

Every screen will be a window into a massive network. Computers will respond to commands that are spoken, scribbled and pointed at, as well as typed. Users may reach for a mouse or may prefer their remote control.

This means application developers will have to master new kinds of interfacing techniques,

A "techno-artist" would be able to combine the talents of a storyteller, musical director and software developer with the management experience to direct large multimedia projects.

where an "event" might just as easily be triggered by someone someday pointing to a sensitive area in a 3-D holograph as it is by someone today moving the mouse arrow to a sensitive area of the screen.

In the communications area, skill in telecommunications, infrared technology and fiber optics will be important. As companies race to put the emerging high-bandwidth infrastructure to work, "there will be a welcome reception for network administrators who can apply these new sciences to the complexities of wide-area and internetwork connectivity," Millison predicts.

Get back to the basics

But all this glitz and glamour doesn't mean that core skills don't cut it. Understanding how a computer is put together, how a disk drive works, what makes a good software program and how to configure a network optimally are still vital skills.

"These things aren't going to go away no matter how well-insulated we become from them through modern languages, graphical user interfaces and all the other squishy-feely stuff," Breckinridge says.

He pauses, searching for an example. "Sure, we hired a musician to fill a position, and part of his job description is to play video games. But he also happens to be an acoustical engineer and have a degree in physics."

Bass is a free-lance writer based in Santa Barbara, Calif.

Help end the class struggle.

Here's your chance to train the next generation of knowledge workers before they show up for work.

Donate your unused computers, software, and peripherals directly to your local school.

Or contact Computers for Classrooms at one of the numbers below, and we'll direct your donations for you.

Either way, your generosity will pay off in gigabytes.

Because instead of tossing your equipment out, or selling it for a few cents on the dollar, you'll be providing our classrooms with the most powerful teaching aid since teachers.

And getting a tax deduction in the bargain.

So donate the best—and most—equipment you can afford. When you do, you'll be helping a whole new class of people to succeed.

University of Wisconsin - Madison Social Science Computing Cooperative

The Cooperative is a 27-node Local Area Network and a network of 30 DEC and Sun workstations and servers.

VAX/VMS System Manager (entry level)

Handle, install, maintain and upgrade system software; troubleshoot and diagnose system activity, write, maintain and document DEC procedures; run system testbeds; ideal for someone who wants to participate in our user group.

Required: Bachelor's degree, one year of VAX/VMS experience, DEC procedures. Starting salary up to \$30,000 per year plus excellent benefits.

UNIX Systems Manager and Systems Programmer (experienced)

Handle, install and configure system software; troubleshoot system problems; handle user requests; maintain and upgrade system activity, write, maintain and document in-house system software; install and configure hardware to participate in our user group; maintain programs and documentation.

Required: Bachelor's degree, three years experience in UNIX required. UNIX C shell or Korn shell preferred. Starting salary up to \$30,000 per year plus excellent benefits.

Both positions require the ability to work both independently and with a team. Excellent communication skills, both written and verbal, are required. Write clearly in English. How to apply: Send resume and letter of application detailing your qualifications to: Social Science Computing Cooperative, Computer Sciences Department, Social Science Building, University of Wisconsin-Madison, WI 53706. Qualified applications accepted at recruit@cs.wisc.edu. Deadline: 23-AUG-1992

ASSOCIATE SYSTEMS PROGRAMMER

Provident Life and Accident Insurance Company - a national leader in providing insurance, employee benefits and related financial services - has an opening in our computer department for an Associate Systems Programmer. Programming experience and references required. Position involves systems programming and administration for IBM AS/400. Office is located in a region within a day's drive of 75% of U.S. major markets which are Atlanta, Birmingham, Charlotte, Denver, and Seattle.

Position grants to individuals with the following qualifications:

- Prior systems programming experience in an IBM or QLL environment
- Proficiency in, vendor software installation and maintenance
- Knowledge of IBM operating environment
- Knowledge of SQL databases preferred
- Computer language programming used: IBM PL/I compiler, COBOL, especially COBOL experience highly desirable
- C/C++, UNIX or DB2 subsystems experience highly desirable
- Excellent human relations and communication skills
- Willingness to provide 24-hour on-call support

We offer a great benefits package and competitive salaries.

If you are interested in a challenging environment, please submit your resume in confidence to:

Provident Life & Accident Insurance Co.
Attn: ASP
P.O. Box 10000
Charlotte, NC 28249-7100

PROVIDENT COMPANIES

An Equal Opportunity Employer M/F

Virginia Commonwealth University -
Family Practice Department

Coordinator of Information Systems Instructor

Department will serve as a key interface for faculty and students to maintain and develop medical informatics systems, support a statewide physician information system, and support the development of a statewide electronic medical record system. Experience required includes knowledge of the design and implementation of medical informatics systems. Must possess good analytical and communication skills. BSQD required. Preference in PC-DOS, OS/2 and UNIX. Experience in VAX/VMS, MACINTOSH, and other platforms working with databases, University faculty and physicians preferred.

Virginia Commonwealth University is an Equal Opportunity/Affirmative Action Employer. Minorities, women, disabled individuals and veterans are encouraged to apply. Please send CV's to C. Jones, Box 831, Richmond, VA 23284-0831.

Recruit top talent regionally or nationally with Computerworld

You can recruit qualified computer personnel across the United States when you place your advertising in *Computerworld*.

That's because *Computerworld* gives you your choice of regional or national editions to deliver your recruitment advertising message. And because you'll reach more than 629,000 computer professionals every week - including the nation's top talent.

Call Lisa McGrath at 800-343-6474 (in MA, 508-879-0700).

Weekly. Regional. National. And it works.

NETWORK INVENTORY MANAGEMENT SOFTWARE

'My vendor didn't tell me that. . .

shopper alert!

By Alice Bredin

Network professionals are not insulated from bad buys. They often learn on the job about troublesome product characteristics that were never mentioned during pre-sale discussions with the vendor.

These problems can be inconvenient, but more important, they can result in poor network performance. In a recent poll, network professionals shared their complaints, frustrations and advice on purchasing network inventory management software.

...the software isn't compatible with older PC models.

■ When network administrator Barbara Vernon Ryan bought network inventory software for her San Francisco-based computer, Specialty Brands, Inc., she did not get what she bargained for. Although she was told the software was designed to run on any Intel Corp.-based 80386 PC, it did not run on some of the company's older non-Intel 286s.

When it did, the PCs froze, making it necessary to modify the network script-

ing to exclude the older systems from the software. Unfortunately, the vendor had neglected to mention this quirk.

Vernon Ryan now knows that even though software is compatible with a certain system type, that does not mean it will run on every one.

"Now I ask for a database of known problems with the software. I also want to be put in touch with a customer that has an almost identical network so I can uncover the problem myself," Vernon Ryan explains.

...the software won't let me choose the frequency of network scans.

■ One of the features Sandra Duplhy, a local-area network administrator at Ocean Spray Cranberries, Inc. in Middleboro, Mass., wanted but did not get was the freedom to designate how often the inventory package scans the system to determine what software is running. Some packages have this capability, but others mandate a search every time the system is turned on. Duplhy has learned that vendors do not necessarily mention this difference because it is a significant drawback.

"You may want the machine to execute

the process of checking what's on the system only once a week because you don't want the user to spend 10 minutes logging on each time," she says.

...the software only accepts user IDs to identify users on the network.

■ Some packages identify the user by a user identification; others use a network interface card address. A package relying on user IDs will prevent a company from keeping track of its systems because it logs the user onto all systems on the network.

The problem with this method is that it registers the user as having all of the company's software on his desktop. Network interface card addresses reflect only what software is installed on the system a person is working on.

"We need an approach that doesn't have to walk around to every desk and see what each person has," Duplhy explains. "This way, when your boss asks, 'What does Mary Jo have on her desk?', you know."

...the quality of the report prints in poor.

■ Roseee Floyd, LAN specialist at Human Keeling Co., a pharmaceutical distributor in Calumet City, Ill., says his vendor failed to tell him the network inventory package he bought does not generate polished reports.

Although Floyd says that he is pleased

with the package's systems monitoring capability, the hard copy reports are unfortunately not suitable for widespread use.

When the vendor was called to task, it acknowledged the weakness.

"I now have to plug the inventory information into WordPerfect to make nice-looking reports. Next time, I will ask to see an example report to check the quality," Floyd says.

...the software inventories by file name only.

■ Wayne Robertson, network administrator at Saint Agnes Medical Center in Fresno, Calif., has also learned a lesson the school of hard knocks. He purchased a network inventory package and discovered that it did inventories by file name only, rather than by examining the code.

"The problem with this approach is that if I save a file WIP, the system may think it's WordPerfect. If I doesn't examine a few lines of the file's code," Robertson says. "These packages are operating on guesswork instead of closely examining files."

Robertson says he learned how to ask the right questions when he finally determined he could not assume anything. "Vendors are delivering a functional piece of software, but just because it runs doesn't mean it's going to meet all my needs," Robertson says. "I used to make a lot of assumptions. Now I make a lot of enemies for asking so many questions."

Street favors Parallan ...

Parallan Computer, Inc. (PLN) seems to be the investment analyst favorite among superserver vendors right now.

Parallan's local-area network servers are sold through IBM (IBM), providing access to IBM's superior marketing muscle and excellent resources for research and development. IBM recently announced that it will fund development work for Parallan servers running Microsoft Corp.'s (MSFT) interimally awaited Windows NT operating system.

As a result, Parallan found its way onto the Focus List at Needham & Co. and the Best Buicks list at Wolfe, Wotz & Co. Both Wall Street firms said they like Parallan's long-term prospects and recommended purchase of Parallan shares.

Wolfe analyst Paul Blum noted that a narrow reversal shorthand in Parallan's most recent quarter was due solely to the way Parallan elects to recognize revenue from IBM.

Other technology companies that made the Focus List include the following: Cisco Systems, Inc., because of the phenomenal demand for high-end routers; Informix Corp., which Needham & Co. said is still undervalued among relational database management system manufacturers; Sybase, Inc., the leader in earnings per share growth; and PeopleSoft, Inc., which has maintained an early lead in client/server software.

... and transaction processors

Credit-card transaction processors First Financial Management Corp. (FFM) and Envoy Corp. (ENVY) have also drawn attention from Wall Street in recent weeks.

Donaldson, Lufkin & Jenrette Securities Corp. initiated coverage of First Financial Management with a rating of Very Attractive. Market leader First Financial Management handled roughly \$43 billion in merchant credit-card transactions last year and is ready to jump into the lucrative health care processing field.

Smith Barney Shearson, Inc. analyst Keith Mullins upgraded Envoy's rating to Buy in an Aug. 6 report. Having completed the difficult assimilation of two major accounts (totaling 70 million transactions annually), Envoy should begin to pick up steam.

The company is well-positioned in credit-card processing and electronic prescription claims processing. Trends in both arenas point to strong growth potential for Envoy. Mullins said.

—Derek Stalter

Computer Industry

Briefs

PC integrator returns

Earlier Information Services, Inc., re-emerged last week from the ashes of JWP; Inc.'s \$1.2 billion information services division (CW, May 24). The Rye Brook, N.Y., company, which is focused on integrating PC networks at large corporations and government agencies, is led by Dort A. Cameron, principal investor and chairman, and John M. McKenna, former senior executive vice president of JWP Information Services.

PC maker gets cash

Packard Bell Electronics, Inc., has completed arrangements for a \$70 million recapitalization with Congress Federal Corp. of New York. The money will be used by the Chatsworth, Calif., PC maker to refinance its existing debt and provide additional working capital. The refinancing comes weeks after Group Bell purchased a 19% stake in Packard Bell [CW, July 25].

Artisoft profits down

Artisoft, Inc. posted fourth-quarter profits of \$2.2 million, off 50% from the same period last year. Sales in the period were off 9%, to \$19.6 million, the Tucson, Ariz., networking vendor said. For the year, Artisoft earned \$4.4 million on revenue of \$84.6 million. Those figures were down 29% and up 10%, respectively, from fiscal 1992.

SHORTTAKES Sapiens International Corp. posted second-quarter net earnings of \$1.1 million, up 7% from the same period last year. Revenue increased 62% in the period to \$12.2 million, the Cary, N.C., application tools vendor said.... Seagate Systems, Inc., in Marlboro, Mass., said it has reached a global settlement with all claimants that superseded previous agreements regarding all suits arising from restatements of the company's financial results. A court hearing on the settlement is scheduled for Sept. 10.

Land of software opportunities

Israeli technologists find money market niches in the U.S. after Gulf war

By Jean S. Botman
LOS ANGELES

They came from Tel Aviv, Galilee and Jerusalem. They moved to the U.S. to generate sales and working capital. "They" are a growing contingent of Israeli software companies that have found growth and promise in the U.S. computer market.

In many cases, the Israeli firms first expanded operations to Europe in the late 1980s, translating their software products into many languages, including English.

But a further expansion into the U.S., including the establishment of U.S. headquarters, was made in recognition of the growth in client/server, database and open systems software in recent years. Gaining access to U.S. capital was another major attraction for many of these firms. Israel's software industry association lists about 150 software houses, which had combined sales of approximately \$850 million in 1991.

Among the Israeli software firms operating in the U.S. are Magic Software, Inc. and 4th Dimension Software, Inc., both in Irvine, Calif., and Sapiens International Corp. in Cary, N.C. Sapiens and 4th Dimension, a purveyor of systems management software, went public last year. Magic went public in 1991. LanOptics Ltd., a \$7 million networking software firm near Haifa, Israel, that went public last year, has plans to go public again but has not yet done so.

Successful moves

Growth has accelerated for many that came to the U.S. in recent years. Magic Software, which makes database application development tools, projects that 1992 sales will grow 60% over 1991's \$10 million in revenue. Sapiens, which makes rapid prototyping tools, has seen revenue jump from \$19 million in 1991 to \$35 million last year, for example.

Magic Chief Executive Officer David Asia, who was president of the Israeli Association of Software Houses, said many Israeli executives feel that company growth within the borders of their small country, which is approximately the size of New Jersey, is limited. Bni money began chasing some promising Israeli firms after they collaborated with U.S. companies during the Persian Gulf war.

"There was no venture capital in Israel until after the Gulf war because people didn't believe that software was a technology Israeli people could market successfully outside the country," Asia said.

"After the Gulf war, all of a sudden, Wall Street started looking at some potential peace agreements, and venture capitalists started coming here."

The Israeli government also began some incentive programs to boost the country's software industry, Asia said. Israel provides

Promised land
Israeli firms are expanding their horizons in the U.S.
Some examples:

COMPANY	1990 REVENUE	1991 REVENUE	NOTABLE ACTIVITIES
Sapiens	\$39 million	\$99 million	Rapid application development tools
4th Dimension	\$36 million	\$99 million	Systems management software
LanOptics	\$7 million	\$99 million	Networking/ hub software

substantial tax incentives for exporters, reducing some Israeli software firms' taxes to less than 10% of revenue, although the standard corporate tax is several times that. Some Israeli executives say the Israeli government is encouraging an influx of dollars and other hard currencies for international trade.

Making the transition to the U.S. was no easy task. In the aftermath of 4th Dimension took over operations for its U.S. distributor in Orange County, Calif., it had to stage a user group meeting in San Diego.

"We had to rent office space, set up the computers and buy office furniture all at once," President Dalia Prashker said.

Technical support was handled by several Israeli programmers who flew in for the switch-over to U.S. operations. Follow-up trips to the firm's home base in Israel, which took 20 hours to complete, were frequent at first.

Troubles of another sort date back to 4th Dimension's founding in Israel in the late 1980s. Roni A. Eisen, one of the principal stockholders, faced a personal claim from a former business partner. The Israeli investor said he wants to annul the formal dissolution of

Magic CEO David Asia:
"After the Gulf war... venture capitalists started coming."

his financial agreements with Elavav now that 4th Dimension is a success, the company said last week. A 1992 prospectus for the firm states: "A former stockholder of ECS [Elavav Computer Systems Ltd.] has recently written a letter to Mr. Eisen asserting that he is entitled to a 50% beneficial indirect interest in the equity of ECS. Mr. Eisen has advised the company that he believes the assertion is without merit."

Israeli firms suffered during the 1990s, when inflation was running high and firms outside the country were fearful of military attack, Israeli executives said. Block them, the Israeli government offered cooperation, namely joint U.S. firms, providing tax incentives for joint ventures. More recently, Israel's economy has stabilized with low rates of inflation. Listings on Tel Aviv's stock exchange boomed by 30% last year.

Government incentives

Substantial tax reductions and rebates on capital expenditures still motivate Israeli firms to market in the U.S., said Koby ben-Zvi, president of Sterling Software, Inc.'s storage management division in Rancho Cordova, Calif. In 1991, Sterling acquired the Tufex Lab in Galilee, a storage software firm ben-Zvi helped found in the mid-1990s.

It is Israel's small size that is forcing many Israeli firms to seek capital in the U.S. "The [Israeli] market is still very small, with just 4.5 million people," ben-Zvi said. "So the [Israeli] companies go public in New York to try to get investors' attention."

The future for these firms is to market globally, Prashker said. "Right now, the U.S. is the leader in software and hardware," she said. "But in 10 years, the worldwide market is going to be bigger than the U.S. market."

Israeli firms have not limited their plans to U.S. shores. Some are already charting plans for Pacific Rim and South American markets as established businesses re-engineer their computer systems and small ones buy computers for the first time. "Countries like Brazil, Argentina and Mexico are awakening to some prosperity," Prashker said. "But right now, the American market is the most important market in the world."

Global reach

In many cases, the CEOs of these Israeli software firms have nothing to do with the local office.

For instance, the CEO of Sapiens International Corp. has nothing to do with the local office in Cary, N.C.

Prashker, who heads the company's technology to guide aircraft and guided weapons division, "You will find that many of the people in Israel's high-tech industry have their roots in Israel,"

said Dalia Prashker, president of 4th Dimension. "That's where we got our training — and experts — training."

Overview

Tandem recently unveiled an on-line application to help karnoers burs solve space problems with storing laser discs, according to Computerworld Hong Kong. Tandem customer Andrew Wong, manager of the K Club in Hong Kong, says it helps him stock many more songs — from Cantonese opera and pop songs to English oldies to the latest hits from Taiwan. *New York, New York, anyone?*

IT HAD TO HAPPEN

Software Resource International, a business software and consulting Inc. are distributing **Micro Computer Cordon**, anti-virus software that comes packaged with a monitor. The companies are boasting 10% of the products specifically AIDS.

Inside Lines

Opening the pipeline

IBM is expected this week to put more meat on the bones of Multi-Protocol Transport Network (MPTN), its architecture for allowing applications written for one network protocol to run over a backbone based on another. IBM will add MPTN to the TCP/IP artillery, allowing TCP/IP applications to run over either TCP/IP or SNA. Also to be announced is an alliance with PeerLogic that will allow applications written in PeerLogic's Piggy middleware product to run over MPTN backbones.

Powered-up notebooks

Look for Apple to lead off its PowerBook line this weekend with the introduction of the PowerBook 160, a 33-MHz Microvane-based portable that offers stereo speakers, built-in monitor, passive-matrix display. While the dual-display model of the 160, now one display can image on the 160 and a different image on another application on an external monitor simultaneously, something familiar to those machine heads. Retail price will start at \$1,200 for a model with 4M bytes of RAM and an 800-kbyte hard disk.

Fans again

Novell is apparently offloading some fairly strategic product development to AttacheSoft. The E-mail and SNA gateway vendor already has Novell's NetWare for RAA client software; this week Novell is expected to announce that it is selling its AttacheSoft Network Navigator, a software distribution system developed by Novell subsidiary Attache. A Novell exec recently said Navigator is a key element of Novell's centralized network management strategy and will shortly become a NetWare Loadable Module.

Touched

Microsoft will enhance DOS 6.0, bringing out Version 6.2 (to trump IBM's PC-DOS 6.1) in October, according to sources. Microsoft will tweak the product, particularly its DoubleSpace compression utility, and will also let users download DoubleSpace, the sources said. While DOS 6.0's DoubleSpace has drawn attention because of a well-publicized suit filed by Maxx Electronics and questions regarding the stability of the technology, sources close to Microsoft say that it was not the driving force behind the revision. Microsoft intends to add utilities such as write caching, which would make data management more efficient.

James Traglog is free now. The CEO of Tandem, parent company of TandemNet, last week refuted long-standing industry accusations that his company is interested in selling its networking subsidiary. In a letter to investors, prospective and strategic partners, Traglog firmly stated, "The plain and simple truth is TandemNet is not for sale." In an follow-up, Traglog reiterated that while Tandem would entertain equity investments in TandemNet, the networking vendor remains open to joint ventures or acquisitions. However, Traglog also stressed the acquisition of a division made up of TandemNet's Internet business, which was operating under the name of TandemNet Internet, had nothing to do with his deal for US ICX, Aug. 25. Traglog did not disclose his terms for the deal, but he did say TandemNet had to sell off its Internet business and that conventional investment bankers often put out rumors. Traglog said the investment bankers, whom he declined to name, appeared to be more than just talking around. As of late, however, management said the acquisition did not come from Dillon Read or Donaldson Lufkin & Jenrette, NY's two largest investment banks. In fact, we've pioneered it from the beginning.

For most of the time they've been in business, other network hub makers have built simple connectivity devices for departmental LANs.

But Chipcom got its start in the brutal environment of the factory floor. Big factory floors. From our very beginning, we created the equipment needed to reliably hold together large, mission-critical networks for big companies.

We realized very early in the game that building a vast network was one thing. Controlling it was another. And we also recognized that as entire enterprises became networked, the problem would become even more critical.

Which is why we were the first to turn to switching, and why we have been the leaders in switching technology ever since. Whether a particular application requires modular, bank,

port or segment-switching, Chipcom has the solution. And as ATM looks ever closer, Chipcom's cell-switching abilities will be ready for it.

Chipcom is a registered trademark of Chipcom Corporation.

Chipcom switching technology makes true enterprise networking a reality.

No other maker of intelligent hubs offers you the vast array of switching capabilities that Chipcom delivers.

No other line of hubs gives you the ability to engineer an enterprise-wide network with the rock-solid reliability, ease of management and control, and flexibility to handle continued change and growth as Chipcom does. And because our roots were planted in the world of big, far-flung networking, our underlying architecture has always assumed bigness. So you never have to scrap your earlier Chipcom investment as you grow.

When you're thinking big, you should be thinking Chipcom.

When a well-known retailer with over 2,000 stores decided to network their entire operation, they chose Chipcom. A large petrochemical company with refineries in six western states made the same choice. A major insurance company with thousands of offices across the U.S. investigated every hub makers' products before they selected Chipcom.

Hundreds of manufacturing companies, financial institutions, universities and government agencies have learned that if you're building a small network, you have a number of choices. But if you're thinking big, there's only one: Chipcom.

To learn what Chipcom switching technology can do for your organization, call

1-800-228-9930 and ask for your free copy of *Network Switching Solutions*. After all, if you're smart enough to realize what switching can do for your organization, you're smart enough to want to talk to the people who pioneered it.

Object Technology isn't a vision of the future. It's here today.

Making software more powerful and easier to use is what Object Technology is all about. Thanks to Borland's early leadership in object-oriented programming, software users and developers are getting more out of their software tools than ever before. The Object Technology built into applications like the Paradox® relational database and Quattro® Pro spreadsheet make it easier for people to learn and use powerful software. And the power of objects enables companies to extend these tools into scalable client/server solutions. ■ Object Technology lets programmers bring new applications on-line in record time. By allowing programmers to create reusable and extensible code components, products like Borland® C++ and Borland® Pascal reduce the development cycle and the time required to train users. • Discover the benefits of working with the innovation leader. Take a closer look at Borland's Object Technology today. **Call now. 1-800-321-3217, ext. 7211.**
